E. R. Lankester, *Degeneration*, p. 30.

And now to inquire briefly what is meant by *degeneration*. It means literally an unmaking; the undoing of a kind, and in this sense was first used to express the change of kind without regard to whether the change was to perfection or to degeneration, but it is now used exclusively to denote a change from a higher to a lower kind; that is to say, from a more complex to a less complex organization. It is a process of dissolution, the opposite of that process of involution which is peculiar to evolution.

Hypothesis of degeneration, the hypothesis that certain organisms manifesting an inferior grade of structural and physiological characteristics are the degenerate descendants of higher forms. The theory makes the degeneration merely the result of disease of parts; thus, the catfish are descendants from quadrupeds, and have assumed the fish-like form and lost their hind limbs in better accommodating themselves to aquatic life, the small wings of the flightless birds are descendants from those with well-developed wings, which on account of residence in places where they were not much disturbed, have failed to exercise their wings and finally lost the use of them, and they have absorbed the intestinal worms without an intestine due to descent from those with an intestine, but on account of their environment the skin has assumed the function of a nutrient medium and the intestine has been lost. **Lardaceous degeneration.** Same as *lardaceous disease* (which see, under *lardaceous*). **Mucoid degeneration,** the conversion of cells or intercellular substance into a semiliquid translucent substance containing mucus. **Parenchymatous degeneration.** Same as *cloudy swelling* (which see, under *cloudy*). **Pigmentary degeneration,** disturbance of the nutrition of a part, with deposition of pigment. **Wallertan degeneration,** the degeneration of nerve fibers, which have been separated, as by section of a nerve, from certain ganglia which exercise a nutritive influence on them.

The course of development may, in particular cases, lead to numerous regressions, so that we may find the adult animal to be of lower organization than the larva. This phenomenon, which is known as retrogressive metamorphosis, corresponds to the demands of the selection

5. In universities and colleges, an academical rank conferred by a diploma, originally giving the right to teach. The earliest degree was that of *master*, which in the university of Bologna, and others modeled on that (as were the faculties of law in all the old universities), was called the degree of *doctor*. Afterward the lower degree of *bachelor* (later called *bachelior*) was introduced, and the intermediate degree of *licentiate*; but these were not regular degrees, except in the faculty of arts. The degree of bachelor was conferred by the "nation" of the faculty of arts; the others were given by the chancellor, by authority of the pope. Thus, the medieval degrees were. (1) the degree of *determinant*, or bachelor of arts, without a diploma; (2) the *license*; (3) the degree of master of arts; (4) the degree of master

or doctor of theology; (5) the degree of master or doctor of medicine; (6) the degree of doctor of laws. The degrees now usually conferred are bachelor, master, and doctor: as, bachelor of arts, divinity, music, or law; master of arts, doctor of divinity, law, medicine, philosophy, music, etc.

He [Weber] was born at Ipswich in Suffolk, the Son of a Butcher, sent to Oxford by Reason of his Progeny of Wit, so soon, that taking there the first *Degree* of Art, he was called the Bay Bachelor. *Baker, Chronicle*, p. 201.

The University ceased to teach the systematic theology of the schools, and the systematic jurisprudence of the decretals; and the ancient *degrees* of bachelor and doctor of the canon law are known, except during the reign of Mary, no more.

6. In geneal., a certain distance or remove in the line of descent, determining the proximity of blood: as, a relation in the third or fourth *degree*. See first extract, and *forbidden degrees*, below.

In the canon law, *degrees* of relationship is reckoned by the number of steps from the person furthest from the common ancestor to him, in the civil law, by the number of steps from one person up to the common ancestor and down to the other. Thus, a grand uncle is related to his grand nephew in the third *degree* by the canon law, in the fourth *degree* by the civil.

7. In alg., the rank of an equation, as determined by the highest power under which an unknown quantity appears in it. Thus, if the exponent of the highest power of the unknown quantity be 3 or 4, the equation is of the third or fourth *degree*.

8. One of a number of subdivisions of something extended in space or time. Specifically—(a) One of a number of equal subdivisions on the scale of a meteorological or other instrument, as a thermometer. (b) A unit for measuring circular area and the angles subtended by them at their centers, being the 360th part of a circumference, or the 60th part of a right angle. Considered as angular magnitudes, all degrees are equal; considered as lengths of arcs, they are directly proportional to the radii of the circles of which they are parts. This manner of dividing the circle originated with the Babylonians about 2000 B. C., and was brought into use in Greece by the mathematician Hippocrates. It was perhaps in its origin connected with an opinion that the year consisted of 360 days. The common abbreviation or sign for "degrees" is a small circle (°) placed to the right of the top of the last figure of the number of them: as, 45°. The degree is subdivided into 60 minutes, and the minute into 60 seconds. The length of a degree of latitude is the length of an arc of the section of the figure of the sea level by a meridian, the difference of latitude between the extremities of this arc being one degree. (See *latitude*.) It is 69.702 statute miles at the equator, and 69.896 at the poles. The length of a degree of longitude is the length of an arc of the section of the figure of the sea level by a plane parallel to the equator, the difference of longitude between the extremities of this arc being one degree. This is nearly proportional to the cosine of the latitude, and is equal to 69.16 statute miles at the equator.

(c) In *arith.*, three figures taken together in numeration: thus, the number 250,300 consists of two *degrees* (more commonly called *periods*). (d) In *music*: (1) One of the lines or spaces of the staff, upon which notes are placed. Notes on the same degree, when affected by accidentals, may denote different tones, as D, D[♯], and D[♭]; and, similarly, notes on different degrees, as D[♯] and E[♭], may denote identical tones, at least upon instruments of fixed intonation. (2) The difference or step between a line and the adjacent space on the staff (or vice versa). Occasionally, through the use of accidentals, this difference is only apparent (see above). (3) The difference, interval, or step between any tone of the scale and the tone next above or below it, as from do to re, from mi to fa. The interval may be a whole step or tone, a half step or semitone, or (in the minor scale) a step and a half, or augmented tone. See *step, tone, interval, staff, scale*. (To distinguish between degrees of the staff and degrees of the scale, the terms *staff-degrees* and *scale-degrees* are sometimes used.)

(b) One of the phases of the same kind of crime, differing in gravity and in punishment. [*U. S.*]—**Accumulation of degrees.** See *accumulation*.—**By degrees**, step by step; gradually; by little and little; by moderate advances.

Chronic degree, one 360th part of a tropical year.—**Conjunct degrees**. See *conjunction*. **Degree cut**. See *cut*. **Degree of a curve**, the same as its *order*, but the latter term is preferable. **Degree of constraint**. See *constraint*. **Degree of freedom**. See *freedom*. **Discrete degrees**. See *discrete*. **Forbidden or prohibited degrees**, in civil and in canon law, degrees of consanguinity and affinity within which marriage is not allowed.

The determination of these in church or canon law was founded on the prohibitions contained in Lev. xviii, with adherence to the principle that a degree of relationship which bars marriage in one sex bars it equally in the other, and that by Christ's declaration (Mat. xix. 6 and Mark x. 8, confirming Gen. ii. 24) a man and his wife become one flesh. The Roman law prohibited nearly the same degrees, though marriage of a man with his niece was permitted from the time of Claudius until the reign of Nerva, and also from the time of Constantine to that of Constantine. Marriages with a deceased brother's wife and a deceased wife's sister were forbidden by Constantine. Theodosius the Great forbade them between first cousins, and thus was the general rule of the church from that time on. From the sixth to the thirteenth century, marriages within the seventh degree were prohibited; after the fourth Lateran Council (A. D. 1215), only the four within the fourth degree. Marriage between godparents and godchildren was prohibited by Justinian, and this was afterwards extended to include the parents of the children, and later still other relations of these. The present prohibition of consanguinity was put on a par with the godparents. The Council of Trent limited such spiritual relationship to sponsors, to presenters at confirmation, to the persons baptized or confirmed, and the parents of these. In England marriage between first cousins was forbidden till the Reformation. The present English law of both church and state is confirmed to a statute passed under Henry VIII, and revised under Elizabeth, which forbids all marriages not without the Levitical degrees. These degrees were formulated by Archbishop Parker in 1543, and his table is adopted in the 26th canon of 1602, and ordered to be set up publicly in every church. It will also be found printed at the end of every English prayer book. Its provisions have been summarized as follows: A man may not marry the mother or stepmother of his own or his wife's parents; the widow of his father, father-in-law, uncle, brother, son, stepson, or nephew; the aunt, sister, daughter, or niece of himself or his wife; the daughter or stepdaughter of his own or his wife's children. A woman may not marry the father or stepfather of her own or her husband's parents; the widower of her mother, mother-in-law, aunt, sister, daughter, stepdaughter, or niece; the uncle, brother, son, or nephew of herself or her husband; the son or stepson of her own or her husband's children. Marriage with a deceased wife's sister, whether expressly forbidden by the Mosaic law or not, is prohibited as precisely analogous to that with a deceased husband's brother, the marriage of a man with his brother's wife being explicitly prohibited in Lev. xviii. Direct relationship, if in the ascending and descending line, is canonically reckoned as one degree, and marriage prohibited accordingly. In canon law an illicit connection is held to involve the same prohibitions as a marriage.—In **degree**, greatly; to a degree.

He was grieved in *degree*,

York Plays, p. 53.

Local degree, one 360th part of the zodiac. **Simeon's degree**, a certain early medieval degree, conjectured to have been one of bachelor, and to have been conferred upon masters in the University of Oxford. Biblical critics are not agreed as to the origin and significance of the title. See *gradual psalm*, under *gradual*. **To a degree**, to an extreme, exceedingly; as, proud to a degree. [Colloq.]

Of all the delusions against which history and historical geography have to strive, there is none more deeply rooted than the notion that there has always been a land called Switzerland and a people called the Swiss.

E. A. Freeman, *Amer. Lects.*, p. 383.

—Syn. 2. *Illusion*, *Delusion*, *Hallucination*. As now technically used, especially by the best authorities in medical jurisprudence, *illusion* signifies a false mental appearance or conception produced by an external cause acting through the senses, the falsity of which is capable of de-

tection by the subject of it by examination or reasoning. Thus, a mirage, or the momentary belief that a reflection in a mirror is a real object, is an *illusion*. A *delusion* is a fixed false mental conception, occasioned by an external object acting upon the senses, but not capable of correction or removal by examination or reasoning. Thus, a fixed belief that an inanimate object is a living person, that all one's friends are conspiring against one, that all food offered is poisoned, and the like, are *delusions*. A *hallucination* is a false conception occasioned by internal condition without external cause or aid of the senses, such as imagining that one hears an external voice when there is no sound to suggest such an idea. If a person walking at twilight, seeing a post, should believe it to be a spy pursuing him, and should imagine he saw it move, this would be an *illusion*. A continuous belief that every person one sees is a spy pursuing one, if such as cannot be removed by evidence, is a *delusion*; a belief that one sees such spies pursuing, when there is no object in sight capable of suggesting such a thought, is a *hallucination*. *Illusions* are not necessarily indications of insanity; *delusions* and *hallucinations*, if fixed, are. In literary and popular use an *illusion* is an unreal appearance presented in any way to the bodily or the mental vision; it is often pleasing, harmless, or even useful. The word *delusion* expresses strongly the mental condition of the person who puts too great faith in an illusion or any other error; he "labors under a delusion." A *delusion* is a mental error or deception, and may have regard to things actually existing, as well as to illusions. *Delusions* are ordinarily repulsive and discreditable, and may even be mischievous. We speak of the *illusions* of fancy, hope, youth, and the like, but of the *delusions* of a fanatic or a lunatic. A *hallucination* is the product of an imagination disordered, perhaps beyond the bounds of sanity; a slightly or crazy notion or belief, generally of some degree of permanence; a special aberration of belief as to some specific point: the central suggestion in the word is that of the groundlessness of the belief or opinion.

Poetry produces an *illusion* on the eye of the mind, as a magic lantern produces an *illusion* on the eye of the body.

Macaulay, *Milton*.

Dreams or *illusions*, call them what you will,

They lift us from the commonplaces of life

To better things.

In its well-developed stage the disease is marked by delusions, especially of grandeur (megalomania), and by epileptiform or apoplectic attacks, often attended with local paralysis, frequently mending rapidly. It occurs usually between the ages of 35 and 50, and in 7 or 8 males to 1 female. 4. A public exhibition, by a number of persons, of sympathy with some political or other cause, as in a mass-meeting or a procession.—5. Proof, either (a) a process of stating in an orderly manner indubitable propositions which evidently cannot be true without the truth of the conclusion so proved, or (b) the propositions so stated. Properly, demonstration is restricted to perfect proof, especially mathematical proof. (See the extract from *Burgersdicius*, below.) According to the Aristotelian doctrine, which has greatly influenced the use of the word, demonstration must be drawn from principles not only self-evident, but also undervived from any higher principles; and the conclusion must not only be shown to be true, but also to be a mere special case of the truth of one or more of the principles from which it is derived. It was supposed that this was the character of the best mathematical proofs; but mathematical proof consists in constructing a diagram or formula according to certain rules which prescribe that certain relations shall exist between the parts of that diagram, and then in showing by observation (directly or indirectly) that certain additional relations exist between those parts; and no important mathematical proof is of the nature of the Aristotelian demonstration. The word has consequently acquired two significations: first, its original sense of a perfect mathematical proof; second, the sense of a proof drawn from principles, as in the Aristotelian theory. There is also a third signification, according to which a demonstration is any proof which leaves no room for reasonable doubt, such as Kepler's proof that the orbit of Mars is an ellipse. Writers who adopt the Aristotelian view hold that the *reductio ad absurdum* and the Fermatian mode of proof, though entirely convincing, are not perfect demonstrations.

Some an admirable delight drew to Musick; and some, the certainty of demonstration to the Mathematicks. Sir P. Sidney, *Apol. for Poetrie*.

Demonstration is a syllogism made of such propositions as are true, first immediate, and manifestly known, and be the causes of the conclusion. First and immediate here as all one, signifying such propositions as need not be proved or made more evident by any other former propositions. Blundeville.

Demonstration, in the Greek ἀποδείξις, is amongst the geometers a delineation of a diagram, in which they exhibit the truth of their propositions to be seen by the eye. To that is opposed pseudographema: that is, a description or false delineation. Now these words, as many others, which are used in the doctrine of syllogism, are translated from geometry into logic; and the demonstration is taken sometimes for any certain and perspicuous proof, but here in this place strictly for syllogism scientific, and pseudographema, or false syllogism, for syllogism begetting error or contrary to science. Burgersdicius, tr. by a Gentleman.

Demonstration [is] nothing but the perception of such agreement [of ideas] by the intervention of other ideas or mediums. Locke, *Human Understanding*, IV. iv. 7.

In *photog.*, more or less opaque; strong in the contrast of lights and shades: said of a negative exhibiting these characteristics, and capable of giving a brilliant print, or even, if it be too dense, a harsh one, as distinguished from a weak or thin negative, the picture on which presents small contrasts, while its film is inclined to be more or less transparent, even in the lights, and the resulting print is flat. Also expressed by *strong* and *intense*.

With good dense negatives the printing may be conducted in direct sunshine. *Workshop Receipts, 1st ser., p. 257.*

densimeter (den-sim'e-tēr), *n.* [= Sp. *densímetro*, < *L. densus*, dense, + *metrum*, a measure.] An apparatus for ascertaining the specific gravity or comparative density of a solid or liquid, as metals, gunpowder, or sea-water. That used for testing the density of gunpowder consists essentially of a vessel in which the gunpowder is weighed in connection with mercury. The vessel is first partially filled with mercury by creating a vacuum; it is then emptied and a known weight of powder is placed in it, and the mercury again added under the influence of the same vacuum, less being admitted, however, in consequence of the space occupied by the powder. A comparison of the amount of mercury admitted with the weight of the powder gives the specific gravity of the powder. The optical densimeter of Hlguard consists of a glass prism for holding salt water, and a collimating telescope for examining a ray of light passing through the water in the prism, the refraction of the light giving the density of the water by comparison with the known angle of refraction of distilled water or sea water of a known density. *Huck's densimeter* is used for ascertaining the density of syrups while boiling. See *salinometer*.

density (den'si-ti), *n.* [= *F. densité* = Sp. *densidad* = *Pg. densidade* = *It. densità*, < *L. densitas* (t-), thickness, < *densus*, thick; see *dense*.]

1. The quality of being dense, close, or compact; closeness of constituent parts; compactness, actual or relative.

The density of the ether is greater in liquids and solids than in gases, and greater in gases than in vacuo. *Tymol, Light and Elect., p. 62.*

2. The mass or amount of matter per unit of bulk. The mass is the ratio of the living force or double the energy of motion to the square of the velocity. Experiments made by Newton upon the effect of attaching masses of different materials to pendulums have shown that the weights of bodies are precisely proportionate to their masses; consequently, the density is measured by the specific gravity, or the weight of a unit bulk. The unit of density is generally taken as that of water at its temperature of maximum density (4° C., 39° F.) and under ordinary pressure. Inasmuch as the gram was intended

to be, and within the limits of the probable error of the best observations actually is, the mass of one cubic centimeter of water under these conditions, it follows that the density as ordinarily expressed is, as closely as possible, the number of grams in one cubic centimeter of the particular kind of matter in question. The following table shows the density of several important substances: Iridium, 22.4; platinum, 21.4; gold, 19.3; liquid mercury, 13.6; lead, 11.3; silver, 10.5; copper, 8.9; nickel, 8.7; iron, 7.8; tin, 7.3; zinc, 7.2; the earth, 5.6; solution of iodides of mercury and potassium, 3.2; diamond, 3.5; rock, about 2.7; aluminum, 2.6; sulphur, 2.0; magnesium, 1.7; the human body, 1.1; india-rubber, 1.0; alcohol, 0.8; ether, 0.7; lithium, 0.6; vapor of iodide of arsenic, 1.03; air, 0.0013; aqueous vapor, 0.0008; hydrogen, 0.00009. See *specific gravity*, under *gravity*.

The quantity of matter per unit of space is defined as the *density* of the mass filling that space.

A. Daniell, *Prin. of Physics*, p. 194.

The density of a body is measured by the number of units of mass in a unit of volume of the substance.

Clerk Maxwell, *Heat*, p. 82.

3. In *elect.*, the quantity of electricity per unit of volume at a point in space, or the quantity of electricity per unit of area at a point on a surface.

The electric volume density at a given point in space is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the volume of the sphere, when its radius is diminished without limit.

The electric density at a given point on a surface is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the area of the surface contained within the sphere, when its radius is diminished without limit.

The tooth-sheath.—2. An instrument for drawing teeth; a tooth-foreeps.

dental (den'tal), *a.* and *n.* [= *F. dental* = *Sp. Ig. dental* = *It. dentale*, < *NL. dentalis*, pertaining to the teeth (*L.* only in *neut.*, *dentale*, *n.*, the share-beam of a plow), < *L. den(t)-s* = *E. tooth*: see *dent²* and *tooth*.] *I. a.* 1. Of or pertaining to the teeth.—2. In *gram.*, formed or pronounced at or near the front upper teeth, with the tip or front of the tongue: as, *d*, *t*, and *n* are dental letters. The name *dental* is very imperfectly descriptive, as the teeth bear no important part in producing the sounds in question, and even, in the utterance of many communities, no part at all. Hence some phonetists avoid the term, using instead *lingual*, *tongue-point*, or the like.

The Hebrews have assigned which letters are labial, which dental, and which guttural. *Bacon*.

3. Connected with or used in dentistry: as, *dental rubber*; a *dental mallet* or *hammer*.—**Dental arch**, the curved line of the teeth in their sockets, corresponding to the alveolar border of each jaw. The somewhat parabolic curve of this arch in man, and its continuity, are among the diagnostic zoological characters of the genus *Homo*.—**Dental canal**. See *canal*.—**Dental cartilage**. See *cartilage*.—**Dental cavity**, the natural hollow of a tooth; the pulp-cavity (which see).—**Dental chisel**, *cut*, *drill*, *file*, *foramen*, etc. See the nouns.

Dental formula, a formal or tabular statement of the number and kinds of teeth a mammal may have; a formula of the dentition. In which the letters *i*, *c*, *p*, *m*, and *n*, respectively denote incisor, canine, premolar, and molar, and figures are used to indicate the number of each kind of teeth, the figures above a horizontal line (like the numerator of a fraction) referring to the upper jaw, those below the line to the lower jaw. When the letter *d* is prefixed to *i*, *c*, *p*, *m*, and *n*, it signifies *deciduous*, and consequently the formula is that of the milk-dentition. The dental formula is usually written in full, as in the subjoined extract; but since there are always the same number of teeth on each side of either jaw, sometimes only each half jaw is indicated; thus, the formula for adult man would be: $I \frac{2}{2}, C \frac{1}{1}, P \frac{4}{4}, M \frac{6}{6} \times 2 = 32$. See the extract.

The dental formula of a child over two years of age is thus:

$$I \frac{2-2}{2-2}, C \frac{1-1}{1-1}, P \frac{2-2}{2-2}, M \frac{2-2}{2-2} \times 2 = 20;$$

which means that the child should have two incisors, one canine, and two molars, on each side of each jaw. . . . The formula of the permanent dentition in man is written:

$$I \frac{2-2}{2-2}, C \frac{1-1}{1-1}, P \frac{4-4}{4-4}, M \frac{6-6}{6-6} \times 2 = 32;$$

there being two incisors, one canine, two premolars, and three molars on each side above and below.

(a) The soft, sensitive, nervous and vascular substance which fills the cavity of a mature tooth. (b) The tissue or structure out of which a tooth is formed, and from which, as in the case of rodents, it may continue to grow for an indefinite period, in which case the teeth are said to have *perpetual pulp*.—**Dental sac**, a closed dental follicle. See the extract.

The teeth are moulded upon papillae of the mucous membrane, which may be exposed, but are more usually sunk in a fold or pit, the roof of which may close in so as to form a *dental sac*. *Huxley*, *Anat. Vert.*, p. 80.

Dentaliidae (den-tal'i-i-dē), *n. pl.* [*NL.*, < *Dentalium* + *-idae*.] A family of mollusks, constituting the class *Scaphopoda* (or order *Cirribranchiata* of *Gastropoda*); the tooth-shells. They are diadems, headless, eyeless, with a trilobate foot, rudimentary lateral jaws, the mouth surrounded with filiform tentacles; the shell slender, conical, curved, open at both ends, with circular aperture and posterior attachment of the animal; the mantle saccular, open at both ends, the foot being protruded through the larger opening. The larvae are free-swimming and ciliate, with a somewhat bilobular shell, which subsequently becomes tubular. There are about 50 living and upward of 100 extinct species, the latter mostly Devonian. The animals live buried in the mud, where they crawl slowly about. (See *Scaphopoda*, *tooth-shell*.) The family has been divided by recent systematists into various genera, for which the names *Dentalium*, *Antalis*, and *Entalis* have been used. Also *Dentaliidae*.

Dentalium (den-tā'li-um), *n.* [*NL. dentalis*, < *L. den(t)-s* = *E. tooth*: see *dental*.] The typical and leading genus of the family *Dentaliidae*. Different limits have been assigned to it. By the older conchologists it was used for all the *Dentaliidae*, or forms with tooth-like shells; but more recently it has been restricted to *Dentalium* with the posterior end of the tooth-like shell furnished with an internal slightly projecting tube provided with a dorsoventrally elongated opening.

Dentaria (den-tā'ri-i), *n.* [*NL.*, fem. of *LL. dentarius*, pertaining to the teeth: see *dentary*.] A genus of cruciferous plants, natives of the cooler portion of the north temperate zone. It is nearly allied to *Cardamine*, with which it is united by some authorities, differing mainly in its few opposite or subverticillate cauline leaves, and in its scaly creeping or tuberous rootstocks. From its toothed pungent roots it derives the names of coral-root, toothwort, pepper-root, etc. The flowers are large, white or light-purple.

II. n.; *pl. dentaries* (-riz). The distal or symphyseal piece or element of the compound lower jaw of vertebrates below mammals: so called because it bears or may bear teeth. It commonly forms most of the lower jaw as visible from the outside. In birds without teeth it forms about that part of the under mandible which is sheathed in horn. The dentary, as a rule, effects symphysis or unites with its fellow of the opposite side at its distal end; at its proximal end it is articulated or ankylosed with other bones, forming the proximal part of each half of the lower jaw. See cuts under *Cycloodus*, *Talliner*, and *temporomaxill*.

dentata (den-tā'tā), *n.* [*NL.*, fem. (sc. *vertebra*) of *dentatus*, toothed: see *dental*.] The odontoid vertebra or axis; the second cervical vertebra: so called from the odontoid or tooth-like process which forms a pivot about which the atlas turns. See cut under *axis*.

as ivory, for instance, as distinguished from enamel, cement, or pulp. Dentin resembles bone, but is ordinarily denser and harder. The difference is seen on a micropscopic section, when a multitude of very fine close-set tubules or canaliculi (the dentinal tubes) are seen following a parallel straight or wavy course, and no corpuscles or lacunae appear, while bone-tissue shows abundant corpuscles with the canaliculi radiating in every direction. The corpusculated parts of teeth are the softer constituents, as the cement or pulp, for example, whence the canaliculi alone penetrate the dentin, which is therefore comparable to the canalicular substance of bone in a state of extreme density and hardness. See *cut* under *tooth*.

The notch, nick, or tooth of the bill of the *Dentirostres* is not to be confounded with the tooth of the bill of certain birds of prey, as falcons, nor with the series of teeth of the lagellirostral birds, as ducks. In very many technically dentirostral birds there is no trace whatever of a notch or tooth.

dentirostrate (den-ti-rost'ät'), *a.* [*< L. den(t)-s = E. tooth*, + *rostratus*, beaked, *< rostrum*, a beak; see *rostrum*]. Same as *dentirostral*.

In Cuvier's system of classification, the first family of his *Passerinae*, "wherein the upper mandible is notched on each side towards the point. It is in this family that the greatest number of insectivorous birds occur, though many of them feed likewise upon berries and other soft fruits." They are contrasted with *Fringillidæ*, *Corvidæ*, and *Temnospizidæ*. The immense assemblage of birds here indicated is definable by no common character, least of all by the one assigned by Cuvier, and the term consequently fell into disuse. It is still employed, however, in a modified sense, for a superfamily group of oscine passerine birds approximately equivalent to the turdoid *Passeres* of Wallace. See *Passeres*, *Turdiformes*.

2. In Sundevall's system of classification, a phalanx of the cohort *Cichlomorphæ*; synonymous with *Laniiformes*, as the name of a superfamily group embracing the shrikes and their immediate relatives.—3. That certain men have been chosen as deputies of the people—that there is a piece of paper stating such deputies to possess certain powers—these circumstances in themselves constitute no security for good government.

Macleay, Utilitarian Theory of Government.

3. In law, one who by authority exercises another's office or some function thereof, in the

name or place of the principal, but has no interest in the office. A deputy may in general perform all the functions of his principal, or those specially deputed to him, but cannot again depute his powers. Specifically—
(a) A subordinate officer authorized to act in place of the principal officer, as, for instance, in his absence. If authorized to exercise for the time being the whole power of his principal, he is a *general deputy*, and may usually act in his own name with his official addition of deputy, i.e. *by*. A subordinate officer authorized to act in a particular matter or service, as, for instance, to serve a writ, or to aid in keeping the peace on a particular occasion. In such case he is a *special deputy*.—**Chamber of Deputies**, the (English) title of the second house of the national parliament or assembly in France, Italy, Spain, Portugal, and Rumania. In France it consists (1890) of 584 members, elected for four years by universal suffrage, each *arrondissement* electing one deputy unless its population is in excess of 100,000, when it is divided into two or more constituencies. The number of members is 506 in Italy, 140 in Portugal, 183 in Rumania, and one for each 60,000 inhabitants in Spain. The chamber is the popular branch of the legislative assembly, and is in general the branch in which financial measures originate.

weightings of numerous early coins, has been found equal to 43.7 grains troy, making the value of the coin about 9 United States cents; while the latter would be heavier in the ratio of 10 to 9, so that it would be 48 grains. This is still approximately the mass of the derham (weight) in most localities; though in some places it shrank nearly to 40 and in others rose almost to 50 grains, and in Abyssinia is even said to be only 40 or 41 grains. There was in early times a derham of half the usual weight, and two units of this name now employed in Persia are equal to nearly 150 and 300 grains respectively. The Moroccan coin, the derham, is reckoned equivalent to 74 United States cents.

It is similar to the crane, but differs from it in having the boom, which corresponds to the jib of the crane, pivoted at the lower end so that it may take different inclinations from the perpendicular. The weight is suspended from the end of the boom by ropes or chains that pass through a block at the end of the boom and thence directly to the crab, a winding-apparatus or motor at the foot of the post. Another rope connects the top of the boom with a block at the top of the post, and thence passes to the motor below. On shipboard a derrick is a spar raised on end, with the head sheaved by guys and the heel by lashings, and having one or more purchases depending from it to raise heavy weights. **Floating derrick**, a movable derrick erected on a special boat or vessel. Such derricks have a single central post or support, and a horizontal boom supported at some elevation on the post and carrying a traveling carriage which bears the block from which the load is suspended. The boom is supported by stays from the top of the post, and is also counterbalanced by means of stays run from the opposite end of the boom to the deck of the vessel on which the derrick is built. But it would be better to say that it is a property or proposition which relates to the incidence or coincidence of points, lines, and other geometrical elements, in general, or that it is one which does not depend upon the particular system of measurement adopted. Thus, the

proposition that two triangles are equal if a side and two angles of the one are equal to the corresponding side and angles of the other, may be regarded as *descriptive*; while the proposition that through any point in space a single parallel to a given line can be drawn, is indubitably *metrical*, not *descriptive*.

We have in the plane a special line, the line infinity; and on this line two special (imaginary) points, the circular points at infinity. A geometrical theorem has either no relation to the special line and points, and it is then *descriptive*; or it has a relation to them, and it is then *metrical*. *Salmon.*

II. n. A desert place or region; a waste; a wilderness; specifically, in *geog.*, a region of considerable extent which is almost if not quite destitute of vegetation, and hence uninhabited, chiefly on account of an insufficient supply of rain: as, the *desert* of Sahara; the Great American *Desert*. The presence of large quantities of movable sand on the surface adds to the desert character of a region. The word is chiefly and almost exclusively used with reference to certain regions in Arabia and northern Africa and others lying in central Asia. (See *drift*.) The only region in North America to which the word is applied is the Great American *Desert*, a tract of country south and west of Great Salt Lake, once occupied by the waters of that lake when they extended over a much larger area than they now occupy. The name *Great American Desert* was originally given to the unexplored region lying beyond the Mississippi, without any special designation of its limits. Colonel Dodge, U. S. A., says in "The Plains of the Great West" (1877): "When I was a schoolboy my map of the United States showed between the Missouri River and the Rocky Mountains a long and broad white blotch, upon which was printed in small capitals 'The Great American Desert' 'Unexplored.' . . . What was then regarded as a desert supports, in some portions, thriving populations." In Fremont's report the Great Basin is frequently spoken of as "the Desert." It is also called the *Great Desert Basin*.

A *wilderness* may be full of luxuriant vegetation. In a great majority of the places where *desert* occurs in the authorized version of the Bible, the revised version changes it to *wilderness*.

3. In *math.*, the sum of all the products which can be formed of a square block of quantities, each product containing as a factor one number from each row and one from each column of the block, and each product being affected by the plus or minus sign according as the arrangement of rows from which its factors are

taken (these factors being arranged in the order of the columns from which they are taken) requires an even or an odd number of transpositions to reduce it to the arrangement in the square. A determinant is conventionally denoted by writing the square block of quantities between two vertical lines. For example,

$$\begin{vmatrix} A & B \\ a & b \end{vmatrix} = Ab - aB.$$

$$\begin{vmatrix} A & B & C \\ a & b & c \\ \alpha & \beta & \gamma \end{vmatrix} =$$

$$Aby - Afc + aBc - ab\gamma - aBc - a\gamma B.$$

The different products of which a determinant is the sum are called its *elements*. The different quantities which are multiplied to form the elements are called the *constituents* of the determinant. The oblique line of places from the upper left hand to the lower right hand corner is called the *principal diagonal*. The conjugate line of places is called the *secondary diagonal*. The square root of the number of constituents is the ordinal number of the *order* or *degree* of the determinant. — **Adjugate determinant**, one each of whose elements is the cofactor of the corresponding term of the determinant to which it is adjugate. — **Axisymmetric determinant**, same as *symmetric determinant*. See below. — **Bialar determinant**, same as *bialar*. — **Bordered determinant**, a determinant whose matrix is formed from another by adding new rows and columns, especially where a single row and column are added, with a zero at their intersection. — **Centrosymmetric determinant**, one which is symmetric with respect to both diagonals. — **Characteristic determinant** of a matrix, the determinant of a matrix formed from the given matrix by adding the same indeterminate quantity to each constituent of the principal diagonal. — **Complementary determinant**, a determinant related to a partial determinant, to which it is said to be complementary, by having for its constituents all the constituents of the total determinant which belong to rows and columns from neither of which any constituent of the partial determinant has been taken, the sign of the complementary determinant being determined by taking its matrix as it stands in the lower right-hand corner of the matrix of the total determinant, when the matrix of the partial determinant has been brought to the upper left-hand corner, without altering the value of the total determinant. — **Composite determinant**, a sum of determinants whose matrices are obtained by successively omitting all the different combinations of n -columns from a rectangular block of quantities having m -rows and n -columns. The composite determinant is usually denoted by writing its oblong matrix with two vertical lines on each side. — **Compound determinant**, a determinant whose constituents are themselves determinants. — **Cubic determinant**, a quantity formed on the analogy of a determinant proper from a cube of quantities as constituents. — **Cyclic determinant**, same as *circulant*. — **Determinant of a linear transformation or substitution**, the determinant whose constituents are the coefficients of the equations of transformation regularly arrayed. — **Functional determinant**, one in which all the constituents in each row are differential coefficients of one quantity, while all the constituents in each column are differential coefficients with respect to one variable. — **Gauche determinant**, same as *skew determinant*. See below. — **Minor determinant, or minor of a determinant**, a determinant whose matrix is formed from the matrix of another determinant by erasing part of the rows and columns. — **First minor**, a minor formed by erasing one row and one column; **second minor**, a minor formed by erasing two rows and two columns, etc. — **N -dimensional determinant** of the n th order, a function of n constituents, analogous to an ordinary determinant. — **Orthosymmetric determinant**, one all the constituents of which, having the sum of the ordinal places of the row and column the same, are equal. — **Partial determinant**, same as *minor determinant*. — **Persymmetric determinant**, one which is symmetrical with reference to both diagonals. — **Reciprocal determinant**, a determinant each constituent of which is the corresponding first minor of the determinant of which it is the reciprocal. — **Skew determinant**, one in which every constituent of the n th row and n th column is in every case the negative of the one in the n th row and n th column, except on the principal diagonal. — Also called *gauche determinant*. — **Skew symmetric determinant**, a skew determinant in which all the constituents of the principal diagonal vanish. — **Symmetric determinant**, one in which the constituent in the n th row and n th column is in every case equal to that in the n th row and n th column. — **Zeroaxial determinant**, one in which the constituents of the principal diagonal are all zeros. [The name *determinant* in a narrower sense was introduced by Gauss, and was first applied in the present sense by Cauchy.]

12. [ML. *determinatio questionis*, the answering a question, the posing of theses to be defended.] In Oxford and other old universities: (a) A solemn disputation in which the respondent is a bachelor of arts, and which is preparatory to graduation as master of arts. (b) A disputation or other act substituted in recent times for the old disputation. The determinations were kept in Lent, and hence often called the *Lent determinations*. Originally, in the University of Paris (the model of most of the old universities of northern Europe, and especially of Oxford and Cambridge), there was but one degree, that of master of arts, carrying with it the right to lecture regularly in the university. The purpose of the determinations was to enable the masters to judge whether the candidate was fit to be presented to the chancellor as candidate for the mastership; and since there were no examinations, there was no other regular means of ascertaining the candidate's fitness. The baccalaureate was at first called the *determinance*, and was originally not a degree, nor conferred by the university, but merely a permission to *determine* or act as chief respondent in the Lent disputations, and was conferred by the "nation." In consequence of this inseparable connection between the baccalaureate and the determinations, the latter are often considered as conditions of the former, although they follow in time.

Hence — 13†. A discussion of a question according to the scholastic method, after the model of a disputation.

deutoplasm (dū-tō-plazm), *n.* [*< Gr. δευτερος*, second, + *πλάσμα*, anything formed, *< πλασσειν*, form, mold.] In *embryol.*, secondary, nutritive plasma, or food-yolk: a term applied by the younger Van Beneden to that portion of the yolk of an egg or ovum which furnishes food for the nourishment of the embryo, but does not enter directly into its formation or germination. The great bulk of the yolk of oöblastical ova, as birds' eggs, consists of the nutritive deutoplasm or food-

yolk, as distinguished from the protoplasm or tread, which makes up into the body of the chick.

In fact, the contents of every egg consist of two parts—(1) of a viscous albuminous protoplasm; and (2) of a fatty granular matter, the deutoplasm or food yolk. The first is derived from the protoplasm of the original germinal cell, while the yolk is only secondarily developed with the gradual growth of the first; and not infrequently it is derived from the secretion of special glands.

2. In *photog.*, to induce the chemical changes in (the film of a plate which has been exposed in the camera or of a gelatino-bromide print) necessary to cause a latent image or picture to become visible, and, in the case of a negative, to assume proper density to admit of reproduction by a process of printing.—3. In *biol.*, to cause to go through the process of natural evolution from a previous and lower stage, or from an embryonic state to a later and more complex or perfect one.

Where eyes are so little *developed* that approaching objects are recognized only as intercepting the sunshine, it is obvious that contrasts of light and shade which seem marked to animals with *developed* eyes are quite imperceptible. H. Spencer, Prin. of Psychol., § 22.

4. In *math.*: (a) To express in an extended form, as in a series, which lends itself more readily to computation or other treatment. (b) To bend, as a surface, especially, to unbend into a plane.—*syn.* 1. To uncover, unfold, disentangle, exhibit, unravel.

II. intrans. 1. To advance from one stage to another by a process of natural or inherent evolution; specifically, in *biol.*, to pass from the lowest stage through others of greater maturity toward the perfect or finished state: as, the fetus *develops* in the womb; the seed *develops* into the plant.

2. In *geom.*, reducible to a plane by bending; applied to a particular species of ruled surface, otherwise called a *torse*, which is conceived as formed by an infinite succession of straight lines, each intersecting the next. **Developable helicoid.** See *helicoid*.

II. *n.* In *geom.*, a singly infinite continuous succession of straight lines, each intersecting the next; a *torse*. The word *developable* is used as a noun by modern geometers, because they do not consider this locus to be properly a surface. It is rather a skew curve regarded under a particular aspect. A developable is generated by a line which turns about a point in itself, while this point moves along the line. The locus of the point is a skew curve, called the edge of regression of the developable, to which the line is constantly tangent. The developable is thus the locus of tangents of a skew curve. Considering the osculating plane at any fixed point of this curve, the moving tangent comes up to this plane so that for an instant its motion is in the plane and then passes off; and the result is that the curve is a cuspidal edge of the developable considered as a surface. **Polar developable** of a skew curve, the surface enveloped by its normal planes. The locus of the center of curvature of the skew curve is the edge of regression, while the axis of curvature is the generator of the polar developable.

Specifically, in *photog.*, the chemical bath in which a sensitized plate or paper is, after a photographic exposure to the light, immersed to develop or bring out the latent image. Developers for the ordinary dry-plate process may be divided into two principal classes, *alkaline developers*, and *ferrous-oxalate developers*, the first generally employing carbonate of soda or potash in combination with pyrogallol acid, and the second using oxalate of potash with protosulphate of iron. The results obtained are practically the same with either bath, the latent image in the film being made visible, and the chemical changes induced being fixed, or made permanent in the fixing bath, which follows the developing bath. Many other chemicals may be used in development, either in combination with some of those mentioned above or in independent combinations. See *photography*.

M. Balguy claims "that with this chemical he has developed plates without fog in such a light as would have been impossible . . . with other known developers."

Philadelphia Ledger, Feb. 28, 1888.

In *photog.*, the process by which the latent image in a photographically exposed sensitive film is rendered visible through a chemical precipitation on that portion of the sensitized surface which has been acted on by light. The matter deposited varies with the nature of the process. In the daguerrotype process it is mercury; in negative processes with salts of silver it is silver combined with organic matter.

Compasses are frequently elevated above the deck on tripods or masts to obviate the effects of the ship's magnetism, the direction and amount of which depends to a certain extent upon the position of the ship's head with reference to the points of the compass while building. In iron ships a careful determination of this error, with the ship's head on every point of the compass successively, is essential to safe navigation. — **Primary deviation**, in *ophthal.*, the deviation of the weaker eye from that position which would make its visual line pass through the object-point of the healthy eye. — **Secondary deviation**, in *ophthal.*, the deviation of the healthy eye from the position which would make its visual line pass through the object-point of the weaker eye.

See -fication.*] Loss, either partial or entire, of the glassy or vitreous condition, or the process by which this result is attained. The most conspicuous illustration of devitrification is the production of "Reaumur porcelain" from glass by the long continued action of heat. (See *porcelain*.) The term *devitrification* is much employed by lithologists in describing the changes which have taken place in rocks consisting originally, either wholly or in large part, of glass. (See *lava* and *obsidian*.) It may be the result of cooling, during which crystalline products have developed themselves in the glass in greater or less perfection; or it may have taken place in consequence of the action of water, either with or without the aid of heat, after the rocks had become solidified. Pressure is also regarded by many as being an agent of high importance. The changes thus indicated may be begun in a rock during its consolidation, and afterward continued under the combined influence of heat, water, and pressure, even to the entire obliteration of its original vitreous character, the result being the production of a purely lithoid structure. The minute forms developed in the process of devitrification, which are

incipient crystals, or glass beginning to lose its unindividualized character, have received various names from lithologists, according to their shape and manner of grouping. See *microlith* and *globulite*.

-Syn. *Devote, Dedicate, Consecrate, Hallow, destine, set apart.* In *dedicate* and the cognate words *devote, devout*, etc., the root idea is always that of a complete mental consecration; thus, *devotion* (def. 2) is the consecration of the entire mind to God and his worship; and a *devout* (def. 2) spirit is one entirely absorbed in the worship or service of God. To *devote* indicates the inward act, state, or feeling; to *dedicate* is to set apart by a promise, and indicates primarily an external act; to *consecrate* is to make sacred, and refers to an act affecting the use or relations of the thing consecrated; to *hallow* is to make holy, and relates to the character of the person or thing hallowed. Thus, we *devote* ourselves by an act of the mind; we *dedicate* our lives or property by a more formal act; we *consecrate* to sacred uses a building not before sacred; and we *hallow* the name of God, recognizing in it its inherent holy character.

Dew is thus deposited chiefly on bodies which are good radiators and poor conductors of heat, like grass; hence also it appears chiefly on calm and clear nights—that is, when the conditions are most favorable for radiation. dextrine (deks'trin), *n.* [= *F. dextrine, < L. dexter, right, + -ine.*] The soluble or gummy matters, having the general formula $(C_6H_{10}O_5)_n$, into which starch is convertible by diastase or by certain acids. It is white, viscid, and without smell, and is remarkable for the extent to which it turns the plane of polarization to the right hand, whence its name. Its composition is the same as that of starch. By the action of hot diluted acids, or of an infusion of malt, dextrine is finally converted into grape sugar. It is used as a substitute for gum arabic in medicine and the arts. Also called *gummiacum, moist gum, starch-gum, British gum, and Alsace gum*.

dextrocardia (deks-trō-kār'di-ā), *n.* [*NL., < L. dexter, right, + Gr. καρδιά = E. heart.*] In *teratol.*, a congenital condition in which the heart is turned toward the right instead of the left side.

dextroglucose (deks'trō-glō'kōs), *n.* [*< L. dexter, right (see dextrose), + E. glucose.*] Same as *dextrose*.

See *polarization*. Also *dextrorotatory*.

If the analyzer has to be turned towards the right, so as to cause the colours to succeed each other in their natural order—red, orange, yellow, green, blue, indigo, violet—the piece of quartz is called right-handed or *dextrogyrate*.
Radde.

dextrogyrous (deks-trō-jī'rūs), *a.* [*< L. dexter, right, + gyros, a circle: see gyre.*] Gyrate or circling to the right.

Cf. sinistrors.*] Rising from right to left, as a spiral line, helix, or climbing plant. (In botany this word is used in opposite senses by different authorities. Bentham, Hooker, Darwin, Gray, etc., use it as above defined. Linnæus, Braun, the De Candolles, and many others give it the opposite meaning.)

dextrose (deks'trōs), *n.* [*< L. dexter, right, + -ose.*] A sugar $(C_{12}H_{22}O_{11})$ belonging to the glucose group, which crystallizes from aqueous solution with one molecule of water in nodular masses of six-sided scales. It is readily soluble in water and alcohol, has a taste less sweet than ordinary cane sugar, and directly reduces alkaline copper solution. It is dextrorotatory to polarized light. Dextrose is widely distributed, being found in most sweet fruits, grapes, raisins, cherries, etc., usually associated with levulose. It also occurs sparingly in various animal tissues and juices, and in excessive quantity in diabetic urine. Dextrose is manufactured from starch in large quantity by the action of sulphuric acid. It is used for making cheap syrup, called glucose syrup, in the manufacture of beer, and for adulterating molasses. Also called *d. xylo-glucose, grape-sugar, and starch-sugar*—*Biotatory dextrose*. See *biolation*.

dextrotropous (deks-trot'rō-pus), *a.* [*< L. dexter, right, + Gr. τροπή (cf. τροπή, a turning), < τρέπω, turn.*] Turning to the right: opposed to *levotropous*. Also *dextrotropic*.

Among the duties of the *dey* is mentioned that of feeding the young and weak of a flock or herd with foreign milk; this, in connection with the regular duty of milking the cows, gives some color to the phonetically doubtful derivation from Sw. *degga*, OSw. *dagga*, suckle, = Dan. *dagge*, feed with foreign milk, *cado*, coddle (prob. not connected with Sw. *din* = Dan. *din*, suck, = AS. *ppr.* "dunde, lictantes" (only in Benson's Lex.); see *dag2*. di-². [*L. etc.*, *di-*, < Gr. *di-*, two-, double, combining form of *dis*, adv., twice, doubly (= *L. bis*, *bi-* = Skt. *dvī-* = E. *twi-*, etc.), < *dō* = E. *two*: see *bi-²*, *twi-*, *two*.] A prefix of Greek origin, cognate with *bi-²* (which see), and meaning 'two-', 'twofold', 'double', as in *dipterous*, two-winged, *diptych*, a two-leaved tablet, *diarchy*, government by two, etc. In chemistry it denotes that a compound contains two units of the element or radical to which *di-* is prefixed; as, manganese *dioxid*, MnO₂, a compound of one atom of manganese and two of oxygen.

diabase (di'g-bas), *n.* [*< dia-*, erroneously for *di-²*, double, + *basē*.] The form simulates (Gr. *diá basē*, a crossing over, < *diabainein*, go through or over, < *diá*, through, + *baivō*, go: see *basis*.) The name originally given by A. Brongniart to a rock which Italy later designated as *diarite*, which name Brongniart himself adopted in preference to that of *diabase*. Later (in 1842) Hausmann again introduced the word *diabase*, and by it designated a variety of pyroxenic rock, occurring in the Harz, and characterized by the presence of chlorite in considerable quantity. At the present time the name *diabase* is used to designate a crystalline-granular rock, consisting essentially of augite and a trichitic feldspar, with more or less magnetite or titaniferous iron, or both, and occasionally apatite or olivine, to which is added chloritic matter in varying amount. To this chloritic material the name *irridite* is frequently applied, this being the substance which gives the mass the greenish color which it frequently has. Diabase is one of the rocks included under the popular designation of *greenstone*, and also under that of *trap*. It is an altered form of basalt. "The main difference between *diabase* and *basalt* appears to be that the rocks included under the former name have undergone more internal alteration, in particular acquiring the diffused 'irridite' so characteristic of them" (Griekie, 1885). See *greenstone*, *trap*, *diarite*, and *melaphyre*.

diabetes (di-g-bē'tēz), *n.* [NT., < Gr. *diabainein*, make a stride, walk or stand with the legs apart, also cross over, pass through: see *diabatorial*.] In *pathol.*, the name of two different affections, *diabetes mellitus*, or persistent glucosuria, and *diabetes insipidus*, or polyuria, both characterized in ordinary cases by an abnormally large discharge of urine. The former is distinguished by the presence of an excessive quantity of sugar in the urine, and to it there is a strong tendency to restrict the name. Light and evanescent grades of glucosuria are not considered as diabetes, and doubtless frequently have an entirely different causation. The disease is chronic and generally fatal. Its essential pathology is unknown. It is not an affection of the kidneys, but depends upon the accumulation of sugar in the blood, or glycohemis. (See *glycosuria*.) *Diabetes insipidus*, or polyuria, is characterized by the discharge of abnormally large quantities of ordinary or watery urine.

Thus, the marks attached to *u* in the forms *u*, *ü*, *u*, are diacritical marks, or diacritics. So in the angular German running hand the letter *u* (*u*) is written thus, *u*, to distinguish it from *n* (*n*), and the dot over the *t*, formerly used also over *u*, has a like office. The area of the diagram measures the total work performed by the piston during the stroke. This work, expressed in foot-pounds, divided by Joule's equivalent, gives the heat-equivalent of the work performed, in British thermal units. (See *indicator*.) 2. One of a number of related modes of speech, regarded as descended from a common original; a language viewed in its relation to other languages of the same kindred; the idiom of a district or class, differing from that of other districts or classes. Thus, the Scotch is a dialect of English; English is a dialect of the Germanic or Teutonic group; Germanic speech is an Aryan or Indo-European dialect. Of the various dialects of Greek — Attic, Ionic, Doric, Æolic, and so on — the Attic finally became the common dialect of all cultivated Greeks. Every literary language is originally one of a body of related dialects, to which favoring circumstances have given vogue and general acceptance.

II. n. [= *F. dialectique = Sp. dialectica = Pg. dialectica = It. dialectica = G. Dan. Sw. dialektik, < L. dialectica, < Gr. διαλεκτική (see δίαλεκτος), the dialectic art, the art of discussion, logical debate, also the logic of probabilities, from δίαλεκτικός, belonging to disputation: see I.*] 1. Logic, or a branch of logic; specifically, the art of critical examination into the truth of an opinion; inductive logic applied to philosophy; the logic of probable reasoning; the art of discussion and of disputation; logic applied to rhetoric and refutation. The invention of the art of dialectic is attributed to Zeno the Eleatic, whose arguments against motion are examples of the original meaning of the Greek word. The famous dialectic of Socrates and Plato, their chief instrument of philosophical inquiry, was a conversational discussion with inductive appeals to special instances. Dialectic was limited by Aristotle to logic accommodated to the uses of the rhetorician, appealing only to general belief, but not to first principles. The Stoics, who probably introduced the term *logic*, divided that art into rhetoric and dialectic, the former being the art of continuous discourse, the latter that of discussion with an interlocutor. Cicero and other Latin writers, influenced by Stoic doctrine, understood by dialectic "the art of discussing well" (*ars bene disserendi*). It thus became the name of that branch of the trivium of the Roman schools which we call logic, and retained that meaning throughout the middle ages. Hence, in all the earlier English literature, it is the synonym of *logic*, differing from that word only by a more distinct suggestion of the idea of disputation. Modern logicians have frequently restricted it to the doctrines of the Topica and Sophistical Eleatic, or to the former alone. It has also been used as a synonym of *sylogistic*. Kant named the constructive part of his Transcendental Logic *transcendental analytic*, and the destructive part *transcendental dialectic*. For the sake of this phrase, he makes dialectic, in general, the theory of fallacies. According to Hegel, each concept in the development of thought by a primitive necessity develops its own dialectical opposite, and to this reaction of thought against itself, regarded not as final, but as subject to a subsequent reconciliation in a higher order of thought, he gave the name of *dialectic*.

There hath not been, to my understanding, sufficiently inquired and handled the true limits and use of reason in spiritual things, as a kind of divine *dialectic*. *Bacon, Advancement of Learning, II. 864.*

We termed *Dialectic* in general a logic of appearance. This does not signify a doctrine of probability; for probability is truth, only recognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful. *Kant, cr. by Meiklejohn.*

St. Paul, though bred in the *dialectic* of the Greek schools, came late by his conversion to the new faith, and remained a Jew to the last. *Alcott, Table-Talk, p. 90.*

It remains true that the value of the *Dialectic* which asks and gives such an account of ideal good as at once justifies and limits obedience to practical authorities is conditional upon its finding in the individual a well-formed habitual morality. *T. H. Green, Prolegomena to Ethics, § 228.*

—5. In *chem.*, the act or process of separating the soluble crystalloid substances in a mixture from the colloid, depending on the principle that soluble crystalloid bodies will diffuse readily through a moist membrane, while colloids diffuse very slowly, if at all. This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment-paper stretched over a wooden or gutta-percha hoop, having its edges well drawn up and confined by an outer rim. The parchment is allowed to float in a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the water beneath, while the colloid remains behind. Thus, rumel or broth containing a very little arsenic dissolved in it gives up the whole of its arsenic to the water, while scarcely a trace of the organic substance passes through. As almost all the poisons in common use—arsenic, corrosive sublimate, oxalic acid, lead acetate, morphia, and salts of strychnine, etc., are crystalloids, the toxicologist is by this process furnished with an easy mode of detecting their presence, if they are in a form readily soluble in water.

II. *n.* A substance which is diamagnetic in a magnetic field of force. See **diamagnetism**, 1.

diamagnetism (di-ā-mag'net-izm), *n.* [= *F. diamagnetisme*; as *diamagnet-ic* + *-ism*.] 1. The phenomena exhibited by a class of substances which, when under the influence of magnetism and freely suspended, take a position with the longer axis at right angles to the magnetic lines of force. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two divisions, the *paramagnetic* and the *diamagnetic*. Among the former are iron, nickel, cobalt, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe magnet, it points in a line from one pole to the other, which Faraday terms the *axial line*. On the other hand, when a diamagnetic substance is suspended in the same manner, it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

The magnetism of two iron particles lying in the line of magnetization is increased by their mutual action, but, on the contrary, the *diamagnetism* of two bismuth particles lying in this direction is diminished by their mutual action. *J. E. H. Gordon, Elect. and Mag., II, 21.*

If, however, the magnetism of the molecules were so much increased that they held each other tight, and so could not be turned round by ordinary magnetizing forces, it is shown that effects would be produced like those of *diamagnetism*. *W. K. Clifford, Lectures, I, 241.*

It. diametro*, < *L. diametros*, < *Gr. διάμετρος*, the diagonal of a parallelogram, diameter of a circle (cf. *diapetēr*, measure through), < *διά, through, + μέτρον, a measure*; see *meter*.] 1. In geom., a chord of a circle or a sphere which passes through its center; in general—(a) a chord of a conic cutting it at points tangents to which are parallel; (b) a line intersecting a quadric surface at points where the tangent planes are parallel. The conception was extended by Newton to other algebraic curves by means of the following theorem:

a. Diameter of a Circle.

In arch., the diameter of the lower face of the shaft of a column, divided into 60 parts, forms a scale by which all the parts of a classical order are commonly measured. The 60th part of the diameter is called a *minute*, and 80 minutes make a *module*.

These numbers are 1, 3, 7, 17, 41, 99, etc. (b) A number resolvable into two factors the sum of whose squares is a square. Thus, 120 is such a number, because $120 = 8 \times 15$ and $8^2 + 15^2 = 17^2$.—**Diametral planes,** in crystal, those planes which are parallel to the vertical and one of the lateral axes; a prism formed by such planes is called a *diametral prism*.

2. A precious stone, distinguished from all others by being combustible and by its extreme hardness, as well as by its superior refractive and dispersive power. It consists of pure or nearly pure carbon, leaving only a very small quantity of ash when burned. Its specific gravity is about 3½; its crystalline form is the isometric, and it cleaves readily in planes parallel to the faces of the regular octahedron.

Natural crystals are found in a great variety of forms belonging to the isometric system. The crystalline planes of the diamond have this peculiarity, that they are frequently more or less convex, instead of being flat, as those of crystals usually are. The range of color of the diamond is extensive, but hues of light yellow, or straw-color, and brown are of most common occurrence. Diamonds of a decided color, such as green, blue, or even red, are found, but they are extremely rare; only one deep-red diamond is known. A diamond is of the *first water* when it is without flaw or tint of any kind. The value of the gem increases in an increasing ratio with its weight up to a moderate size; beyond that there is no fixed value. A first-water diamond of one carat being considered worth \$100, one of two carats would be held at \$300, and one of ten at \$11,000. The most desirable form in which the diamond may be cut is called the *brilliant*. (See cuts under *brilliant*.) Diamonds formerly came chiefly from India, and later from Brazil; the present principal source of supply is southern Africa, where they are found associated with a peculiar rock of unequivocal volcanic origin. In all other diamantiferous regions diamonds have been found only in the surface detrital material (gravel and sand), or else, rarely, in rock of fragmental origin. See *borá*.

diamond-cutting (di'-a-mond-kut'ting), *n.* One of three processes by which diamonds are prepared for use as ornaments or in the arts, the others being diamond-cleaving and diamond-polishing. Diamond-cutting is performed by rubbing together two diamonds secured with shells in wooden holders or lundies, one of which is held in each hand of the cutter over the edge of a box called a cutters' box, into which the dust is allowed to fall. This rubbing is continued until each diamond assumes the proper outline, whether brilliant, rose, or briolette, the smaller facets being afterward made by polishing. Both stones are cut at the same time, irrespective of size or shape, or of the outline to be produced. Diamond-cutting is sometimes performed by machinery. In this case one of the handles or dops is stationary and the other is moved backward and forward, both diamonds being cut at the same time, but more rapidly and accurately than by hand.

(b) A ring, or a plate pierced with a circular hole so arranged as to fall in the axis of the instrument, used in optical instruments to cut off marginal beams of light, as in a camera or a telescope. Such diaphragms are often made movable, especially for photographic lenses, so that one with a large opening may be inserted when it is desired to admit abundant light to the lens, in order to use a short exposure, and one with a small opening when sharpness of detail is more desirable than shortness of exposure. 3. In *anat.*, the midriff; the musculomembranous partition which separates the thoracic from the abdominal cavity in mammals. In man the diaphragm consists of a muscular sheet whose fibers

radiate from a trefol tendinous center to attach themselves to the lower margins of the thorax, and behind form a large bundle on either side, called *pillars of the diaphragm*. The diaphragm is pierced by three principal openings: the *esophageal*, for the passage of the esophagus accompanied by the pneumogastric nerves; the *aortic*, for the passage of the aorta, thoracic duct, and large azygos vein; and the *caval*, for the inferior vena cava; besides some others for splanchnic nerves, etc. The diaphragm is invested on its thoracic surface by the pleural and pericardial serous membranes; on its abdominal surface by the peritoneum, a fold of which, reflected upon the liver, forms the suspensory ligament of that organ. The diaphragm is deeply concavo-convex, the convexity upward; the general figure is that of an umbrella. It is a powerful respiratory muscle, contracting at each inspiration and so flattening, while its relaxation in expiration renders it more convex; its contraction also assists in defecation and in parturition, and its spasmodic action is concerned in hicough and sneezing; when most relaxed it rises to the level of about the fifth rib. A rudimentary diaphragm exists in birds; it is best developed in the apteryx.

Gladstone, *Studies on Homer*, II, 83.

But these fables only purport to be Bahrms spoiled, after having passed through the hands of a diaseuast: that is, some late writer who has turned his verses into barbarous Greek and wretched metre.
Knyce, *Brit.*, III, 181.

It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113°, a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. Diastase is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. In solution it possesses the property of causing starch to break up at the temperature of 150°, transforming it first into dextrin and then into sugar.

diastasis (di'ā-si'ā-sis), *n.*; pl. *diastases* (-sēz). [*N.L.*, *< Gr. διάστασις*, a separation, *< διαστέλλω*, pres. *διαστέλλω*, separate, cause to stand apart, *< διά*, apart, + *στέλλω*, pres. *στέλλω*, cause to stand, = *E. sta-nd*.] Forcible separation of bones without fracture, as the result of external mechanical injury or direct violence; dislocation; luxation.

[*L.L.*, an interval, esp. in music, *< Gr. διάστημα*, an interval, difference, *< διαστέλλω*, separate: see *diastasis*.] *1.* In *zool.* and *anat.*, an interval between any two consecutive teeth, especially between any two series or kinds of teeth, as between the canines and premolars or incisors, or among the incisors, as in many bats. When there are no canines, as in rodents, diastema occurs between the incisors and the premolars. It necessarily occurs when opposing teeth are so long that they cross each other when the mouth is shut. Man is notable as having normally no diastemata, his teeth forming a continuous series, and being all of approximately equal length. But the same is the case with some other mammals, as in the genera *Tarsius* and *Aploglossus*. *2.* In *anc. Gr. music*, an interval. Also *diastem*.

The term is also extended to some other pulsating organs, as lymph-hearts, and specifically to the expanding action of the contractile vesicle of infusorians and other protozoans.

2. The period or length of time during which a rhythmically pulsating vessel is relaxed or dilated; the time-interval which alternates with *systole*. — *3.* In *Gr. gram.*, a mark similar in position and shape to a comma, but originally semicircular in form, used to indicate the correct separation of words, and guard against a false division, such as might pervert the sense. Such a sign was needed to obviate the confusion arising from the ancient practice of writing without division between words. The diastole is still occasionally used, generally in order to distinguish the pronominal forms *εἶ*, *τις*, and *ἐν*, 'whatever', which, from the particles *εἰ*, 'that', and *ἐν*, 'when'. The usual practice at present, however, is to use a space instead of the diastole. When the present shape of the comma came into use, more or less confusion between it and the diastole necessarily ensued. Also called *hypodiastole*. See *hypphen*.

4. In *anc. pros.*, lengthening or protraction of a syllable regularly short; especially, protraction of a syllable preceding a pause or taking the ietus: as,

Ire negabamūs et tectā ignota subire,
Ovid, *Metamorph.*, xiv, 320.

Most cases of diastole in Latin poetry are supposed to be instances of reversion to an older pronunciation, though the pause which usually follows could of itself make good the metrical deficiency. This reversion is seen chiefly in verb-terminations with final *t* and *r*: as,

Callidus ut solat humeris portare viator.

Horace, Satires, I. v. 90.

As understood by recent naturalists, it is limited to *Diastylis* and *Leptostylis*; these have the integuments strongly indurated, body and tail sharply defined, and the carapace large and vaulted, with a conspicuous rostriform prominence.

angles, forming a zigzag chain, and the valves composing them only meet at the edges without overlapping. There are about a dozen species, found on submerged plants and stones.

Diatomaceæ (di-ā-tō-mā'sē-ē), *n. pl.* [NL., *< Diatoma + -aceæ*.] An order of microscopic unicellular algae, much resembling the *Desmidiaceæ*, from which they are distinguished by a silicification of the cell-wall and by the presence of a brownish pigment which conceals the green of the chlorophyll. Each frustule is composed of two separate and similar parts (valves), the edges of which usually fit one over the other like the lid of a box. They vary greatly in the form and markings of the valves, which are often exquisitely sculptured, forming beautiful objects under the microscope and testing its highest powers. In some species the lines are found to equal 125,000 to the inch. [See *di-*, two-, + *κότυλον*, a cavity: see *cotyledon*.] A plant which produces an embryo having two cotyledons. *Dicotyledons* form a natural class of the phanerogamous series of plants, characterized by the two opposite cotyledons, an exogenous mode of growth, and a netted venation of the leaves, and by seldom having a trimerous arrangement of the parts of the flower. From the structure of the stem, increasing by external growth, they are also known as *exogens*. The gymnosperms, in which the embryo has several cotyledons in a whorl, are usually included as a subclass, but by some recent botanists they are ranked as a distinct class. According to the more usual arrangement, the angiosperms *dicotyledons* are divided by the characters of the perianth into *Polypetales*, *Tranpetales*, and *Apetales* or *Monochlamydeae*. These are subdivided into 164 orders. Several modifications of this system have been adopted, especially by continental European botanists, the most important of which is the distribution of the apetalous orders among the two other divisions. The total number of species of *dicotyledonous* plants now known is about 80,000, included under about 6,000 genera. See *exogen*.

Dictyophyllum (dik'ti-ō-fī-lum), *n.* [NL., < Gr. *diaktyon*, a net, + *φυλλον* = L. *folium*, leaf.] A genus of fossil ferns established by Lindley and Hutton, remarkable for its double system of nervation, consisting of a system of larger meshes enclosing another system of smaller ones, the whole bearing considerable resemblance to leaves of dicotyledonous plants. Hence some fossil leaves really belonging to the dicotyledons have, probably by mistake, been referred to this genus. Some authors are at present inclined to regard *Dictyophyllum* as a convenient name under which to place the description of fragments of doubtful character considered as belonging to the ferns. See *Idiophyllum* and *Phyllites*.

Dictyophyton (dik'ti-ō-fī-ton), *n.* [NL., < Gr. *diaktyon*, a net, + *φυτον*, a plant.] The name given by Hall to a genus of remarkable fossils of obscure affinities, which have been compared with algae of the family *Dictyota*. It is also considered as being closely related to, or identical with, the genus *Phanotria* of Vanuxem. The latter genus exhibits itself in the form of circular or stellate fronds, made up of ligulate, radiating, and concentric bands or striae, which have the appearance of being interwoven like basketwork. With these stellate forms are associated others which are conical or cylindrical, marked externally by cross striae which divide the surface into rectangular spaces, and sometimes covered with long tubercles arranged in vertical and transverse rows. These latter forms are those which Hall included under the generic name of *Dictyophyton*. They are found in the Chenung group (Devonian) in New York, and in the Waverly group (Lower Carboniferous) of Ohio.

Dictyoptera (dik'ti-ō-p'tē-rā), *n. pl.* [NL., < Gr. *diaktyon*, a net, + *πτερον*, a wing.] A group of cursorial orthopterous insects, the cockroaches, *Blattidae* or *Blattina*, elevated to the rank of an order. Leach; Burmeister.

by Guthrie to a genus of fossil ferns closely resembling *Neuropteris*, but differing from that genus by its reticulate nervation. It is abundant in the coal-measures of Europe and the United States.

Dictyopyge (dik'ti-ō-pī-jē), *n.* [NL., < Gr. *diaktyon*, a net, + *ρυγή*, buttocks.] A genus of Triassic ganoid fishes, remains of which occur in the coal-fields of Virginia: so called from the reticulated appearance of the large anal fin. Lyell, 1847.

Dictyotaceae (dik'ti-ō-tā-sē), *n. pl.* [NL., < Gr. *diaktyon*, netted, latticed (< *diaktyon*, a net), + *-acea*.] An order of olive-brown algae with expanded membranous fronds. In their reproductive characters they are intermediate between the *Florideae* on the one hand and the *Fucales* and *Phaeophyceae* on the other.

Dictyotaea (dik'ti-ō-tā-sē), *n. pl.* [NL., < Gr. *diaktyon*, netted, latticed, + *-ea*.] See *Dictyotaceae*. Same as *Dictyotaceae*.

Leaf of *Dictyopteris fronsenii*, and portion of same on larger scale. (From Weiss's "Flora der Stein-Kohlenformation.")

The leaf-scars of dictyoxylon are subpentagonal in form, broader than they are long, and have a slight groove at the upper end.

dicyan, dicyanogen (di-si'an, di-si-an'-gjen), *n.* [*di-* + *cyan* (cyan).] See *cyanogen*.

Dicyema (dis-i-e'mi), *n.* [NL., < Gr. *di-*, two-, + *kyema*, an embryo, a fetus, < *kyen*, to be pregnant.] A remarkable genus of ciliated filiform parasites found in the renal organs of cephalopods. The body consists of an elongated axial cell extending from one end to the other, invested in a single layer of comparatively small, flattened, nucleated, and ciliated cortical cells arranged like a pavement epithelium.

lum around the axial cell, the anterior of these, or polar cells, being distinguished from the succeeding or parapolar cells. The organism is a simple cell aggregate, without connective, muscular, or nervous tissue. Reproduction takes place by the formation of gemmae on the axial cell. The gemmae are of two different kinds, vermiform and infusoriform, whence the name. Those *Dicyema* which give rise to the former kind are termed *Semadicyema*, the others *Rhynchodicyema*.

There are two genera, *Dicynodon* and *Anomodont*, including lacertiform animals, sometimes of large size, with crocodilian teeth in four or five of which form a sacrum; with a massive skull, lacertilian in most of its characters, but with chelonian jaws, which were doubtless caused in a horny beak; and as a rule with two great tusks, one on each side of the upper jaw, deeply socketed in the maxilla, and growing from persistent pulps. **2.** A family or subordinal group of *Anomodontia*; same as *Dicynodontidae*.

dicynodontian (di-sin'-o-don'-ti-gu), *a. and n.* **I. a.** Of or pertaining to the *Dicynodontia*. Didelphia (di-del'-fi-a), *n. pl.* [NL., < Gr. *di-*, two-, + *delph*, womb. Cf. *Didelphys*.] The *Marsupialia* or marsupial inclaminal mammals; one of the three subclasses of *Mammalia*, the other two being *Ornithodelphia* and *Monodelphia*. They have no placenta, and the womb double, whence the name—that is, the uterine dilatations of the vivipara continue through life distinct from each other, right and left, and open into two distinct vaginæ, which de bouch in turn into a urogenital sinus, forming, with the termination of the rectum, a common cloaca enclosed by the external sphincter muscle, and in the male looking the penis, which thus appears to protrude from the anus. The female has usually an abdominal pouch or marsupium, formed by a fold of the skin of the belly, in which the mammary glands open; and into which the blind, naked, and imperfectly developed young are received and carried for some time hanging to the nipples. The scrotum of the male occupies a similar position. Both the marsupium and the scrotum are supported to some extent by the marsupial bones characteristic of this group, being ossifications in the tendon of the external oblique muscle of the abdomen, articulated with the pubes. A cremasteric muscle in relation with these bones acts in the female upon the mammary glands, effecting their compression, and consequently the flow of milk into the mouths of the helpless young. There are true teeth of two or three kinds. The coracoid is reduced to a process of the scapula, as in ordinary mammals, not reaching the sternum, as in monotremes. The corpus callosum is rudimentary or wanting, and the brain relatively small. The *Didelphia* are among the oldest known mammals, and formerly had an extensive range, but are now mainly confined to the Australian region, the American opossums offering the principal exception. Some of the extinct forms were of great size; the kangaroos are the largest living representatives. The marsupials are notable for their great physiological adaptation to all the modes of life of ordinary mammals, their structure being modified in relation to the carnivorous, the herbivorous, the rodent, and other habitues, and their modes of progression and general economy being no less diverse. There is but one order, *Marsupialia* (which see).

The dental formula is: 5 incisors in each upper, 4 in each lower half-jaw; 1 canine, 3 premolars, and 4 molars in each half-jaw. The vertebral formula is: cervical 7, dorsal 13, lumbar 6, sacral 2, caudal 19 or more. The family is confined to America, where it alone represents the division of marsupial mammals. =Syn. 1. Die, Expire, Decease, Perish. To die is to cease to live, part with life, or become dead from any cause, and under any circumstances; it is the plainest and most direct of the words. *Expire* is often used as a softer word than *die*; it means to breathe out the life or emit the last breath. *Decease* is a euphemism, like *expire*, but is often an affectionation. *Perish* represents death as occurring under harsh circumstances of some sort, as violence or neglect; it emphasizes the idea of finality.

die², v. and n. An obsolete spelling of *dye*.

die³ (di), n.; pl. dice (dis); in the remaining senses, *dice* (dis). In def. 2 the word hardly admits of a plural. [The mod. sing. form *die* is due to the peculiar form of the pl., *dice*, ME. *dys*, etc. (see *dice*); the sing. would otherwise be **dee*. < ME. *dee*, a die, < OF. *de*, earlier *det*, pl. *des*. F. *dé* = Pr. *dat* = Sp. Pg. *da*, *dado*, a die, cube, pedestal (whence E. *dado*, q. v.). < L. *datum*, a die, after the Rom. forms], < L. *datum*, lit. what is given, but taken in the sense of 'what is cast or thrown,' neut. of *datus*, pp. of *dare*, give, in many phrases used as equiv. to 'cast' or 'throw' (cf. G. *würfel*, a die, < *werfen*, throw). Thus *die³* is a doublet of *datal*, *datum*, and *dado*: see *dice*.]

1. A small cube marked on its faces with spots numbering from one to six, used in gaming by being thrown from a box or the hand, the chance being decided by the highest number of spots turned up, and in several other ways. The number of dice used is either one, two, three, or five, according to the game.

The roots, as in many other plants of the order, are very acrid and caustic, and the name *dumb-cane* has been given to *D. Seurina* in the West Indies, from its effect upon the speech when its root is bitten.

See *residual*.—**Dielectric capacity,** same as *specific inductive capacity* (which see, under *capacity*).

II. n. A substance through or across which electric force is acting. The walls of a Leyden jar; the intervening medium, solid, liquid, or gaseous, between the plates of a condenser; and the insulating sheath around the conductor of a telegraph-cable, are examples of dielectrics. Electric induction across a dielectric causes a stress in it which, if great enough, will produce rupture. The maximum intensity of this stress which the material can bear is called its *dielectric strength*. When the dielectric strength of the air between two clouds, or between a cloud and the earth, is unable to withstand the electric forces, a flash of lightning takes place. The fracture of stones in buildings, of trees, etc., in a thunderstorm are illustrations of the effect of excessive dielectric stress.

Until this subject [induction] was investigated by Faraday, the intervening non-conducting body or *dielectric* was supposed to be purely negative, and the effect was attributed to the repulsion at a distance of the electrical fluid. Faraday showed that these effects differed greatly according to the *dielectric* that was interposed.

In Greek manuscripts these dots were frequently written over *a* and *o* beginning a word or a syllable, thus serving also to show that they did not form the close of a diph-

abrog (a, e, i, u, v, x, y, z), and their modern use is an extension of this. The employment of the dieresis to mark the full pronunciation of the letters *ae*, as termination of the preterit and past participle (for instance, *præstitit*), though sometimes seen, is not established usage, the acute or grave accent being more common. Its sessions often received specific titles from the places in which they were held: as, the Diet of Worms, 1495 and 1521; the Diet of Augsburg, 1530. The Diet sat in three colleges: (1) that of the electoral princes; (2) that of the princes, in two benches, the temporal and the spiritual; and (3) that of the Imperial cities. See *interference*.

Diffraction Bands.

Thus, if a beam of monochromatic light is passed through a narrow slit and received on a screen in a dark room, a series of alternately light and dark bands or fringes is seen, which diminish in intensity and distinctness on either side of the central line; if white light is employed, a series of colored spectra of different orders is obtained. Similar phenomena of diffraction are obtained from diffraction gratings, which consist of a band of equidistant parallel lines (from 10,000 to 30,000 or more to the inch), ruled on a surface of glass or of polished metal; the spectra obtained by this means are called *interference* or *diffraction spectra*. They differ from prismatic spectra, since in them the colors are uniformly distributed in their true order and extent according to their difference in wave-length; while in the latter the less refrangible (red) rays are crowded together, and the more refrangible (blue, violet) are dispersed. Diffraction gratings are now much used, especially in studying the solar spectrum. The best gratings are ruled on speculum metal with a concave surface (often called *Rowland gratings*, after Professor Henry A. Rowland of Baltimore), and give an image of the spectrum directly, without the intervention of a lens.

Diffusion of force, the phenomena of viscosity in moving fluids. — **Diffusion of gases**, the diffusion through each other which takes place when two bodies of gas are placed in contact, as when a bell-jar of hydrogen is placed base to base over one containing oxygen. After a certain time a homogeneous mixture is obtained, even if the heavier gas is placed below. When separated by a porous diaphragm the relative rate of diffusion can be measured (see *diffusometer*); it is found to be the more rapid with the lighter gas. — **Diffusion of heat**. (a) A phrase employed to express the media by which the equilibrium of heat is effected, viz., by conduction, radiation, and convection. The term is also used, like *diffusion of light* (see *light*), to describe the irregular reflection or scattering of the incident heat (and light) from the surface of a body not perfectly smooth. (b) Conduction of heat. — **Diffusion of liquids**, the diffusion through each other which occurs when two liquids that are capable of mixing, such as alcohol and water, are placed in contact, even in spite of the action of gravity. It is closely related to the phenomena of exosmosis and endosmosis (which see), which take place when the liquids are separated by a porous diaphragm. See also *osmosis*. — **Diffusion of taxes**, the theory that the community as a whole must bear the burden of any tax, no matter upon what commodity or persons it is originally levied. This theory rests on the assumption of perfect competition. — **Diffusion tube**, an instrument for determining the rate of diffusion for different gases. — *Syn.* Spread, circulation, expansion, dissemination, distribution.

II. *n.* A muscle of the lower jaw: so called because in man it has two bellies. In its generalized condition it is a principal depressor of the lower jaw, opening the mouth and antagonizing the temporal and masseteric muscles. It arises from the back part of the skull, and is inserted into the mandible. In man and many other animals (though not in most) it becomes a digastric or double-bellied, the intervening tendon being bound by an aponeurotic loop to the hyoid bone, and the muscle thus becoming an elevator of the hyoid as well as a depressor of the jaw. It arises from the digastric groove of the mastoid, and is inserted into the symphysis menti. With the lower border of the jaw its two bellies, which meet at an angle, bound the surgical triangle of the neck known as the submaxillary space.

(b) One who digests food. (c) That which assists the digestion of food; a medicine or an article of food that strengthens the digestive power of the alimentary canal. (d) A strong close vessel, in which bones or other substances may be subjected, in water or other liquid, to a temperature above that of boiling. It is made of iron or other metal, with an air-tight lid, in which is a safety-valve. In this vessel animal or other substances are placed, and submitted to a higher degree of heat than could be obtained in open vessels, by which means the solvent power of the liquid is greatly increased. It is called in this form (first described in 1621) *Papin's digester*, from its inventor, Denis Papin, a Frenchman. The principle is applied in other forms, and by it various useful products are obtained on a large scale from animal carcasses unfit for other use. In other kinds of digesters the operation is chemical, and does not imply the extreme pressures employed in that above described. Thus, in one kind, nit-galls or other vegetable products are placed in a vessel and saturated with ether; the volatile extract falls in minute drops into a closed vessel below, which is connected by means of a pipe with the top of the upper vessel to prevent the escape of the ether. See *read and tank*. Also *digestor*.

2. The physiological process of converting the food from the state in which it enters the mouth to that in which it can pass from the alimentary canal into the blood-vessels and lymphatics. The principal features of the process, apart from the comminution of the food, are the conversion of starch into sugar and of protein into peptones, and the emulsification of the fats. These changes are effected by the action of soluble ferments furnished by the salivary glands, the gastric glands, the pancreas, and the intestinal glands. The bile is also of service, especially in the emulsification of the fats.

Hence—3. The function or power of assimilating nutriment.

chiefly upon roots dug from the ground. Collectively called *Digger Indians*.

Among all these Indians the most miserable are the root-diggers, who live almost entirely on the scanty roots of plants which are found in the ravines or plains. These poor wretches suffer all the hardships of hunger and want. They are compelled to spend two thirds of the year among the mountains, with no other resource than a little fish and roots. When both these provisions fail, it is impossible to picture the wretched state of these pariahs of the wilderness. Yet they are not downcast; they are ever cheerful, and endure their suffering with dignity. They are open and sociable with strangers and perfectly honest in their transactions.

A mineral vein or lode, on the other hand, may differ very greatly in its contents in various parts, in width as well as in depth.

dilemma (di- or di-lem'm), *n.* [= F. *dilemme* = *Sp.* *dilema* = *Pg.* *It.* *dilemma* = *D. G. Dan. Sw.* *dilemma*, < *l.* *dilemma*, < *Gr.* *δίλημμα*, a conclusion from two premises, < *di-* + *lēmā*, a proposition, assumption: see *lemma*. Not "an argument in which the adversary is 'caught between' (*διὰ τῶν ἀντιθέσεων*) two difficulties," nor derived from *διὰ τῶν ἀντιθέσεων*, 'be caught between.'] 1. A form of argument in which it is shown that whoever maintains a certain proposition must accept one or other of two alternative conclusions, and that each of these involves the denial of the proposition in question. The alternatives are called the *horns of the dilemma*, which is also called a *horned syllogism*. The argument is also called a dilemma, in a looser sense, when the number of such horns exceeds two. The dilemma originated in rhetoric, and was not noticed by logicians before the revival of learning; consequently there has been some dispute as to its logical definition and analysis. The standard example (from Anaxagoras) is as follows: Every woman is fair or ugly; it is not good to marry a fair wife, because she will flirt; it is not good to marry an ugly wife, because she will not be attractive; therefore, it is not good to marry at all. The essential peculiarity of this reasoning is that it involves the principle of excluded middle, the falsity of which would leave ordinary syllogism intact. Logicians, however, have made the dilemma a matter of form of expression, saying that the above argument, for instance, is not a dilemma as long as the first premise reads as above, but that it becomes one if that premise is put in this form: If it is good to marry, it is good to marry a fair wife, or it is good to marry an ugly wife. They have at different times recognized the following forms as dilemmas or as parts of dilemmas, for many logicians hold that a dilemma consists of three syllogisms: (1) *Simple constructive dilemma*: If A, then C; if B, then C; but either B or A; hence, C. (2) *Simple destructive dilemma*: If A is true, if A is true, C is true; B and C are not both true; hence, A is not true. (3) *Complex constructive dilemma*: If A, then B; if C, then D; but either A or C; hence, either B or D. (4) *Complex destructive dilemma*: If A is true, B is true; if C is true, D is true; but B and D are not both true; hence, A and C are not both true. The importance of the kind of reasoning now called dilemma was first strongly insisted upon by the Stoics. Nevertheless, in the Stoical terminology a dilemma is opposed to a *monolemma*, as a conclusion from one premise. This was the origin of the word, and it is only later that it is met with in the modern sense.

Dilemma is an argument made of two members, repugnant one to another, whereof whichsoever thou grantest, thou art by and by taken. Blauderelle, *Logic*, v. 27.

2. A difficult or doubtful choice; a state of things in which the alternatives appear to be equally bad or undesirable.

Wordsworth, Descriptive Stanzas.

diluvianism (dī- or dī-lū-vi-an-izm), *n.* [*< diluvium + -ism.*] A geological theory which is largely based on the supposition of the former occurrence of a universal deluge. In the early history of geology the deluge played an important part, and many leading facts were explained by reference to it.

Linguistic philology has been actually created by it [the scientific movement of the age] out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of *diluvianism*. *Whitney, Encyc. Brit.*, XVIII. 765.

E. deluge, q. v.), < diluere, wash away; see dilute.)*] *1.* A deluge or an inundation; an overflowing.—*2.* Coarse detrital material, wherever found: a term introduced into geology in consequence of a general belief in the past occurrence of a universal deluge. Finer materials, usually occupying the lower parts of valleys, and occurring especially along the courses of great rivers, were called *alluvium* (which see). In the use of the words *diluvium* and *alluvium* (*diluvial, alluvial*) there is an obscure recognition of a fundamental fact in geology, namely, that rivers have been gradually moulding in volume, a condition which necessarily connects itself with diminished creative power. But the idea of a catastrophic period of diluvial action, preceded and followed by repose, such as lie at the base of the bed in the deluge, is no longer in vogue, and the word *diluvium* has become almost obsolete except among German geologists.

dimaris, dimatis (dīm'a-ris, -tis), *n.* [An artificial term.] The mnemonic name of that mood of the fourth figure of syllogism which has affirmative propositions for its premises, one universal, the other particular. The oldest name for this mood seems to have been *dimatis*, of which *dimatis* is an improvement, and *dimaris* is now more commonly used. The following is an example of this mood: Some commendable actions are recognized by the political economists; but every action recognized by the economists is a selfish one; therefore, some selfish actions are commendable. The letters of the word have the following significations: *d*, *a*, and *r* show the quantity and quality of the propositions; *m*, that the reduction is to *dictum*; *i*, that the premises are transposed in reduction; *s*, that the conclusion of the reduction is to be simply converted. See *A. 2* (b), and *conclusion*, 2.

The type-species is *D. ptilirostris*, having the general aspect of *Urotrichus talpoides*; tall vertebrae half the length of the head and body, soles and palms entirely scaly, and snout pilose. dimension (di-men'shon), *n.* [OF. *dimension*, F. *dimension* = Pr. *dimensio* = Sp. *dimension* = Pg. *dimensão* = It. *dimensione* = D. *dimensie* = G. Dan. Sw. *dimension*, < L. *dimensio* (*n.*), a measuring, extent, dimension, diameter or axis, < *dimetri*, pp. *dimensurus*, measure off, measure out (cf. ppr. *dimetiens* (*-is*), as a noun, diameter), < *di-* for *dis-*, apart, + *metiri*, measure: see *measure*.] 1. Magnitude measured along a diameter; the measure through a body or closed figure along one of its principal axes; length, breadth, or thickness. Thus, a line has one dimension, length; a plane surface two, length and breadth; and a solid three, length, breadth, and thickness. The number of dimensions being equal to the number of principal axes, and that to the number of independent directions of extension, it has become usual, in mathematics, to express the number of ways of spread of a figure by saying that it has two, three, or *n* dimensions, although the idea of measurement is quite extraneous to the fact expressed. The word generally occurs in the plural, referring to length, breadth, and thickness.

So does those skills, whose quick eyes do explore
The just dimension both of earth and heaven.

Sir J. Davies, *Dancing*, st. 95.

A dark

Unfathomable ocean, without bound,

Hence—2. A mode of linear magnitude involved (generally along with others) in the quantity to which it belongs. (b) In *phys.*, a linear measure of length, time, mass, or any kind of quantity regarded as a fundamental factor of the quantity of which it is a dimension. If *M*, *L*, *T*, are the units of mass, length, and time, the dimensions of a velocity are said to be *L.T⁻¹*, or one dimension of length and minus one of time; those of an acceleration are said to be *L.T⁻²*; those of a momentum, *M.L.T⁻¹*; those of a force, *M.L.T⁻²*; those of a quantity of energy, *M.L².T⁻²*; those of the action of a moving system, *M.L².T*; those of a horse-power, *M.L².T⁻³*; those of a pressure, *M.L⁻¹.T⁻²*; those of a density, *M.L⁻³*; etc.

We are justified in considering the range, the flat pencil, and the axial pencil, as of the same dimensions, since to every point in the first corresponds one ray in the second and one plane in the third.

Which from the womb I did parturite.

2. Pertaining to dimorphism; exhibiting or characterized by dimorphism, in any sense of that word.

Dimorphic females among insects have been observed. . . . In these cases, as a rule, one of the female forms is more nearly related in form and color to the male; . . . in other cases the differences are more connected with climate and season, and also affect the male.

Claus, *Zoology* (trans.), I. 155.

dimorphism (dī-mōr'fizn), *n.* [= *F. dimorphisme* = *It. dimorfismo*; as *dimorph + -ism*.] 1. The property of assuming or of existing under two distinct forms. Specifically—2. In crystal, the property of assuming two distinct crystalline forms not derivable from each other, as by crystallization. Thus, sulphur assumes one form when crystallizing at a high temperature, and another wholly different when becoming solid at the ordinary temperature. Hence, the same chemical substance may form two or more distinct mineral species. Carbon in one form is the diamond, in another graphite, etc.

According to the observation of Pasteur, instances of *dimorphism* usually occur when the two forms are nearly upon the limit of their respective systems.

W. A. Miller, *Elem. of Chem.*, I. iii. § 4.

Dimorphism in Plants.

1. Submerged and floating leaves of *Calumbo*. 2. Disk- and ray-florets of *Aster*.

of flowers or other parts upon the same plant, or upon plants of the same species.

Dimorphism in flowers may affect the perianth only, and not the *very* or essential organs; or there may be two kinds of flowers as respects these also, but with no reciprocal relations, as in cleistogamous *dimorphism*; or of two kinds essentially alike except in stamens and pistil, and these reciprocally adapted to each other, which is heterogamous *dimorphism*, or, when of three kinds, trimorphism.

A. Gray, *Struct. Bot.*, p. 225.

4. In soci., difference of form, structure, size, coloration, etc., between individuals of the same species. Sexual *dimorphism* is the rule in the animal

kingdom; and differences between the male and female other than in the sexual organs, as well as constant differences between individuals of each sex, without reference to sex, are instances of *dimorphism*.

Dimorphism is thus seen to be a specialized result of variation, by which new physiological phenomena have been developed.

A. R. Wallace, *Nat. Select.*, p. 158.

The phenomena of *dimorphism* and *polymorphism* in the same species, and the sexual differences which have been developed in animals originally hermaphrodite, may be quoted as important evidence of the extensive influence of adaptation. . . . The numerous cases of *dimorphism* and *polymorphism* in either sex of the same species should be regarded from the same point of view.

Claus, *Zoology* (trans.), I. 154.

5. In philol., the existence of a word under two or more forms called doublets; thus, *dent* and *dint*, *fat* and *vat*, *church* and *kirk*, exhibit *dimorphism* developed within English, and *card* and *chart*, *choir*, *quire*, and *churus*, *reason*, *ration*, *ratio*, etc., exhibit *dimorphism* arising outside of English.

Where it [bifurcation] is produced by a foreign word coming into English in different ways, it has been called *dimorphism*: *ration*, *reason*.

P. A. March, *Anglo-Saxon Grammar*, p. 28.

Dimorphodon (dī-mōr'fō-don), *n.* [*< NL. < Gr. di-morphos, of two forms (see dimorph), + dōvōn, Ionic form of dōtos (dōvōr-) = E. tooth*.] A genus of extinct pterosaurian reptiles, or pterodactyls: so called from the fact that their teeth were of two kinds, the anterior long, the posterior mostly very short. The tail was long, and the other characters mostly as in *Rhamphorhynchus*; the metacarpus was comparatively short, and the ends of the toothless jaws were probably sheathed in horn.

dimorphous (dī-mōr'fus), *a.* [*< NL. dimorphus, < Gr. di-morphos, having two forms: see dimorph*.] Existing in two forms; dimorphic: specifically applied in crystallography to a substance whose crystals occur in two distinct forms. Thus, calcium carbonate crystallizes in the rhombohedral form as calcite, and in the orthorhombic as aragonite. See *dimorphism*.

Bodies capable of . . . assuming two forms geometrically incompatible are said to be *dimorphous*.

W. A. Miller, *Elem. of Chem.*, I. iii. § 4.

It is not unlikely that the Guinea worm, . . . which infests the integument of Man in hot climates, may answer to the hermaphrodite state of a similarly *dimorphous* Nematoide.

Huxley, *Anat. Invert.*, p. 352.

The custom of dining at 6 o'clock or later has since become common, except in the country, where early dinner is still the general practice. See extract under *dinner-hour*.

These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a *dinette* at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repast, which has exploded the old-fashioned luncheon of cold viands.

They were characterized by an enormous development of the legs and pelvis in comparison with the rest of the skeleton, a rattle or flat sternum, and rudimentary wings. The extinction of the group is quite recent, since portions of the soft parts have been found, and traditions are current respecting the living birds; but the period to which they survived is not exactly known. See *moa*.

Dinosauria (di'nô-sâr'i-ä), *n. pl.* [NL., less prop. *Deinosauria*, < *Dinosaurus*, *q. v.*] A group of extinct Mesozoic reptiles, mostly of gigantic or colossal size. They were characterized by distinctly socketed teeth; generally flat or slightly cupped vertebrae, some of which were opisthocœlous; a sacrum of four or more vertebrae; numerous caudal vertebrae; a structure of the skull in many respects intermediate between the crocodilian and lacertilian types; unidulatory or saltatory limbs; fore limbs reduced and not known to have had claws; and hind limbs usually disproportionately developed, and with the pelvis presenting a series of modifications tending toward the characters of birds, on which account the group is also called *Ornithoscelida* (which see). The ornithic structure of the legs is best seen in the smaller genera, such as *Compsognathus*. It is exhibited in the presence of a cranial crest, the reduction of the distal end of the fibula, the disposition of the distal end of the tibia, and the relations of the astragalus. In some genera there was a bony dermal armor, in some cases developing great spines. The *Dinosauria* were a polymorphic as well as an extensive group, the limits of which are not settled, owing to the wide range of variation presented by them. They ranged in size from that of the huge iguanodon down to about two feet. By some they are supposed to have included the remote ancestors of birds; others find in them features that recall mammals, especially pachyderms. The order is by some divided into *Dinosauria* proper and *Compsognathia* (which see); it is sometimes ranked as a subclass of *Reptilia*, and divided into *Sauropoda*, *Stegosauria*, *Ornithopoda*, *Theropoda*, and *Hadrosauria*.

The leaves have a dilated petiole and a slightly stalked 2-lobed lamina or appendage with three very delicate hairs and a fringe of stout marginal bristles on each lobe. The hairs are remarkably irritable, and when touched by a fly or other insect the lobes of the leaf suddenly close on the insect and capture it. The most important of these festivals, in the historic period, were those of Attica, which were four in number, celebrated annually: the *Rural* or *Lower Dionysia*, the *Ienaea*, the *Anthesteria*, and the *Dionysia in the City*, or *Greater Dionysia*. The *Lower Dionysia* were a village-festival, celebrated through the rural demes in the month of Poseideon (December), with universal merriment and freedom from restraint, extended even to slaves. Plays were performed during this festival, and from its characteristic songs and jests comedy was developed. The *Greater Dionysia* were observed at Athens in the second half of March, with a grand procession, a set chorus of boys, and the production in competition at the expense of the state, in the *Dionysiac theater*, in honor of the god, of the comedies and tragedies of which those surviving constitute our most precious treasures of ancient literature. See *Bacchus*, *Lenaea*, *Anthesteria*, *choragic*, and *choragus*.

Dioön (di-ō-on), *n.* [NL., < Gr. *δι-*, two-, + *ώον* = *L. ovum*, an egg.] A cyendaceous genus of plants, of which there are only two species, natives of tropical Mexico. The stem is very short and stout, with a crown of large, rigid, and spine-tipped pinnate leaves. The female cone is of the size of a child's head, each scale bearing two seeds as large as chestnuts. The seeds of *D. edule* yield a kind of arrowroot. Also *Dion*.

The genus *Dioönites*, as instituted by Bornemann, consists largely of species previously assigned by authors to *Pterophyllum*.

Diophantine (di-ō-fan'tin), *a.* [< LL. *Diophantus*, Gr. *Διοφάντος*, a proper name, + *-ine*.] Of or pertaining to *Diophantus* of Alexandria, a celebrated Greek arithmetician, who flourished in the fourth century.—**Diophantine analysis**, indeterminate analysis: a method of solving *Diophantine* problems, namely, of solving indeterminate algebraic equations, the solutions being rational numbers. The method consists in introducing an equation involving an indeterminate coefficient, in such a way that the square of one of the unknowns may be eliminated. It therefore depends upon the ingenuity and experience of the calculator. The following is an example: Required to separate a given square number, N^2 , into the sum of two squares. Let x^2 be one of these squares, and let the root of the other be $ax - N$, where a is indeterminate. Then the sum of the two squares will be $(1 + a^2)x^2 - 2aNx + N^2$. Since this is equal to N^2 , we have $(1 + a^2)x = 2aN$, or $x = 2aN / (1 + a^2)$, which is rational.

dioptr (di-op'ter), *n.* [Also, as *dioptra*, < Gr. *dioptra*, a leveling instrument consisting of a plank turning through a semicircle on a stand, and provided with sights at the two ends and a water-level, < *dia*, through, + *opsis*, < *opsis*, in *dioptra*, see *dioptra*, etc.; see *optic*.] 1. An ancient form of theodolite.—2. The alidade or index arm of a graduated circle.—3. An instrument used in craniometry for obtaining projections of the skull.—4. A dioptric.

dioptra, *n.* Plural of *dioptron*.

dioptric (di-op'trik), *a.* and *n.* [Gr. *dioptrikos*, pertaining to the use of the dioptr, < *dioptra*, dioptr; see *dioptr*.] 1. *a.* 1. Affording a medium for the sight; assisting vision in the view of distant objects.

View the asperities of the moon through a *dioptrick* glass, and venture at the proportion of her hills by their shadows. Dr. H. More, Antidote against Atheism, II. 12.

2. Pertaining to dioptries, or the science of refracted light.

These *dioptric* images, when formed by lenses free from spherical and chromatic aberration, are geometrically correct pictures. W. B. Carpenter, Microsc., § 157.

Dioptric system, in light-uses, a mode of lighting in which the illumination is produced by a central lamp, the rays from which are transmitted through a combination of lenses surrounding it. Also called the *refracting system*.

II. *n.* A unit of refractive power of a lens for inverse focal length, equal to unity divided by a meter. The numerical measure of the power of a lens expressed in dioptries is the ratio of one meter to the focal length of the lens, the latter being measured positively in the direction away from the source of parallel rays entering the lens, so that a convex lens with a focal length of half a meter would have a power of 2 dioptries, and a concave lens with a focal length of 250 millimeters would have a power of -4 dioptries.

Owing principally to differences in the length of the inch in various countries, this method (the inch being used as the unit) had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre. This unit is called a *dioptrie* (usually written "D").

dioptrical (di-op'tri-kal), *a.* Same as *dioptric*.

dioptrically (di-op'tri-kal-i), *adv.* By refraction.

And now that it has been shown that these images are not formed *dioptrically*, but are the result of numerous "diffraction-spectra," it is impossible to entertain the same confidence as before. W. B. Carpenter, Microsc., § 277.

dioptries (di-op'triks), *n.* [Pl. of *dioptric* (see *-ics*), after Gr. *dioptrika*, the science of dioptries.] That part of optics which treats of the refraction of light passing through different media, as air, water, or glass, and especially through lenses. The term is now not much used by scientific writers, the phenomena to which it refers being treated under the general head of refraction (which see). See also *lens*, *light*, and *optic*. Also called *anastatics*.

diorama (di-ō-rā-mā), *n.* [Gr. as if **diōraipa*, < *diōra*, see through, < *diō*, through, + *ōraipa*, see. Cf. *panorama*.] 1. A spectacular painting, or a connected series of paintings, intended for exhibition to spectators in a darkened room, in a manner to produce by optical illusions an appearance of reality. The paintings are so executed and arranged that a variety of effects may be induced by varying the direction, intensity, and color of the light; one of the most notable of these effects coming from light transmitted through the picture itself, which is painted in transparent coloring on a thin fabric. Different scenes may be painted on the two faces of the fabric, and a change from one to the other may be made by altering the source of the illumination. A daylight scene may be thus changed with wonderful realism to one by moonlight, or a desert place may become all at once peopled by a busy crowd. The diorama was devised in 1822 by Daguerre (the chief inventor of photography) and Boutton. 2. A building in which dioramic paintings are exhibited.

Dr. H. More, Epistles to the Seven Churches, p. 72.

diorite (di-ō-rīt), *n.* [So called because formed of distinct portions; irreg. < Gr. *diōrizein*, separate, distinguish (see *diorism*), + *-ite*.] The name given by Italy to a rock included among those varieties which had before that time been generally designated by the name *greenstone*. Diorite consists essentially of a crystalline granular aggregate of a trichitic feldspar and hornblende, in very varying proportions, with which are frequently associated magnetite and apatite, and sometimes mica. This rock has usually a thoroughly crystalline structure. Many of the rocks called by the name of *diorite* are, in all probability, altered basalts; some, however, may have resulted from the alteration of andesites, and even of gabbros. In the case of diorite, the alteration has proceeded further than it has in the diabases and melaphyres. See *greenstone* and *diabase*.

At a comparatively late date the Dioscuri were partly confused with the Cabiri.

To the *Dioscuri*, who always retained very much of their divine nature, belongs a perfectly unblemished youthful beauty, an equally slender and powerful shape, and, as an almost never-failing attribute, the half-oval form of the hat, or at least hair lying close at the back of the head, but projecting in thick curls around the forehead and temples. C. O. Müller, Manual of Archaeol. (trans.), § 414.

Flower and Fruit of Persea (*Diospyros Virginiana*).

Of the 150 species, only two are American, of which one is the common persimmon of the United States, *D. Virginiana*, sometimes called *date-plum*. The wood is hard and heavy, and many species yield woods that are valuable for carving, furniture-making, etc. Ebony is the heart-wood of several species, the best and most costly, with the blackest and finest grain, being obtained from *D. reticulata* of Mauritius and *D. Ebenus* of Ceylon. *D. quercifolia* of Ceylon yields calanander-wood, and *D. Karrie* the marble-wood of the Andaman Islands. *D. Kaki*, the Chinese or Japanese persimmon, is cultivated for its fruit, which resembles the plum in appearance and flavor, and has been introduced into southern Europe and the United States. *D. Lotus* of southern Europe has been supposed to be the lotus of the ancients, but its fruit is hardly edible. It is used as a remedy for diarrhoea. The fruits of most of the species are excessively astringent when immature, owing to the amount of tannic acid which they contain.

In uttering a proper diphthong both vowels are pronounced, the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *join*, *now*, *bound*, *out*. An "improper" diphthong is not a diphthong at all, being merely a collocation of two or more vowels in the same syllable, of which only one is sounded, as *ea* in *breach*, *co* in *people*, *ai* in *rain*, *au* in *beau*. (See *digraph*.) In Greek grammar, a proper diphthong is a diphthong the first vowel of which is short; an improper diphthong, a diphthong the first vowel of which is long. The proper diphthongs are *ai*, *ei*, *oi*, *au*, *eu*, *ou*; the improper, *ai*, *ei*, *oi*, *au*, *eu*, *ou*. (Commonly written *ai*, *ei*, *oi*, *au*, *eu*, *ou*; see *iota subscript*, under *subscript*), *no*, *uo*. An improper diphthong not usually distinguished as such is *au*, as in *rauc*, *Epic eras*. Some include *ui* in this class, and some limit the term to *ai*, *ei*.

Whether there were any true diphthongs in Old English, and if not, when they were introduced, is a question which cannot now be answered.

G. P. Marsh, Lects. on Eng. Lang., xvi.

diphthongal (dif- or dip-thōng'gal), *a.* [*< diphthong + -al*.] Belonging to a diphthong; consisting of two vowel-sounds pronounced in one syllable.

To the joint operation . . . of these two causes, universal reading and climatic influences, we must ascribe our habit of dwelling upon vowel and diphthong sounds.

G. P. Marsh, Lects. on Eng. Lang., xxx.

The diphthongization of *o* into *ie*.

Encyc. Brit.

diphthongize (dif- or dip-thōng-iz), *v.* [*< diphthong + -ize*.] *tr.* To change, as a vowel, into a diphthong; thus the *u* of many Anglo-Saxon words has been diphthongized into *ow* in modern English, as in the word *now*.

A tendency to diphthongize vowels in general.

Amer. Jour. Philol., V, 615.

See *homocercal*, *hypural*, *heterocercal*.

Diphycereal Tail of Spotted Burbot (*Lota maculosa*).

Whatever the condition of the extreme end of the spine of a fish, it occasionally retains the same direction as the trunk part, but is far more generally bent up. . . . In the former case, the extremity of the spine divides the caudal fin rays into two nearly equal moieties, an upper and a lower, and the fish is said to be *diphycereal*.

Gegenbaur, Comp. Anat. (trans.), p. 552.

II. n. A mammal which has two sets of teeth. Most mammals have a definite set of milk-teeth which are deciduous, and are displaced and replaced by a permanent set. The latter, as a rule, differ both numerically and otherwise from the former, particularly in the appearance of true molars, which are lacking in the milk-dentition. Thus, in a child there are 20 teeth, none of them molars proper; in the adult there are 32, an increase of three molars above and below on each side.

According to the usual view, these two natures coexist in one person, whereas the Nestorians affirm the existence of a distinct person for each nature. Also improperly *diaphysitism*.

diphyzooid (dif-i-zō-oid), *n.* [*< Gr. diphycē*, of double form (see *Diphyes*), + *zōoid*.] A repro-

The distal set of appendages (in the *Calycephora*) is the oldest, and as they attain their full development, each set becomes detached, as a free-swimming complex *Diphyzooid*. In this condition they grow and alter their form and size so much that they were formerly regarded as distinct genera of what were termed monogastic *Diphydes*.

Huxley, Anat. Invert., p. 131.

being twice active, with an intervening period of rest. It occurs in the zoospores of certain genera of *Saprothecia*, in which the zoospores escape without cilia from the sporangium, and come to rest in a cluster, each forming a cell-wall. After some hours of rest the protoplasm of each spore escapes from its cell-wall, acquires cilia, and enters upon a period of active movement.

diplanetism (dip-lan-tid'-i-an), *a.* [*<* Gr. *διπλῶς*, double, + *ἀντι*, against, + *εἶδος*, form, image.] Showing two images, one reversed and the other direct: applied to a telescope proposed in 1778 by Jeaurat, to be used in taking transits, the coincidence of the two images serving in place of a transit over an illuminated wire. The difficulties of the execution of such an instrument are, however, far greater than those of illuminating a wire.

Diplarthra (dip-lār'-thrā), *n. pl.* [*N.L.*, neut. pl. of *diparthrus*: see *diparthrus*.] *Diparthrous* mammals; those hoofed quadrupeds which exhibit or are characterized by diplarthrisms. diplarthrism (dip-lār'-thrizm), *n.* [*<* *diparthrus* + *-ism*.] The quality or condition of being diplarthrous; the alternation of the several bones of one row of carpals or tarsals with those of the other row respectively, instead of that linear arrangement of the respective bones of both rows which constitutes taxopody (which see): so called because each bone of one row interlocks with two bones of the other row.

Diplarthrism appears in that foot before it does in the fore foot, as in the Proboscidea.

E. D. Cope, Amer. Nat., XXI, 388.

diparthrous (dip-lār'-thrus), *a.* [*<* *N.L.* *diparthrus*, *<* Gr. *διπλῶς*, double, + *ἄρθρον*, joint.] Doubly articulated, as a bone of one row of carpal or tarsal bones with two bones of the other row; characterized by or exhibiting diplarthrism; not taxopodous: as, a *diparthrous* carpus or tarsus; a *diparthrous* ungulate mammal.

The conversion of a taxopod into a *diparthrous* ungulate.

The *diplastic class* of feet comprises those feet in which the thesis or metrically accented part (called by many the arsis) has double the length of the arsis or metrically unaccented part (called by many the thesis). The *diplastic feet* are (1) the *triple foot* (equal to 3 *—* or *—* 3 *—*), the *tribrach*, *trochee*, and *iambus*; and (2) the *hexasemic foot* (equal to 6 *—* or *—* 6 *—*), the *ionic a minore*, the *ionic a minore*, *Molossus*, and *choriamb*.

diplotiscope (di-pli'-dō-skōp), *n.* [*Irreg.* *<* Gr. *διπλῶς*, double, + *εἶδος*, appearance, + *σκοπεῖν*, view.] An instrument for indicating the passage of the sun or a star over the meridian by the coincidence of two images of the object, the one formed by single and the other by double reflection. It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side, reflected from it to the other, and thence through the glass, are not coincident, but gradually approach as the sun or star approaches the meridian, until they exactly coincide at the instant the center of the object is on the meridian; then an eye stationed at the side of the prism and looking toward the transparent side sees only one object.

The terms *contraplex* and *dipleux* are here applied as specific names for designating clearly the way in which the particular simultaneous double transmission to which we wish to refer is effected. Thus, for instance, two messages may be sent over a single wire in the same or in opposite directions, and when we do not care to particularize either, we simply allude to them under the more common generic name of *dipleux* transmission, which includes both. When, however, we wish to speak of either method by itself, we use the term *dipleux* for simultaneous transmission in the same direction, and *contraplex* for that in opposite directions.

Diptera (dip'te-ră), *n. pl.* [NL., neut. pl. of *dipterus*, two-winged: see *dipterous*.] 1. An order of metabolyous hexapod insects. They are two-winged insects, or flies, with two membranous wings with radiating nervures, not folded at rest, a posterior pair being only represented by lobes or polsters; no mandibles as such, but a suctorial proboscis instead, formed of modified mandibles, maxillae, and the central labium, here called glossarium; usually two maxillary but no labial palpi; antennae generally short; two large compound eyes, often of thousands of facets, and three ocelli or simple eyes; and the prothorax and metathorax reduced, the mesothorax being correspondingly developed. Metamorphosis is complete; the larvae are apodal, or with only rudimentary feet; the pupae are usually coarctate (see *cut under coarctate*), sometimes obcordate. The common house fly, blue-bottle, etc., are characteristic examples. The power which many of these insects have of walking on smooth surfaces with back downward is due to the construction of the feet, which act as suckers. They have, besides the ordinary two claws, several little cushions called pulvilli, beset with fine hairs expanded at their tips into a kind of disk; the adhesion is aided in some cases by a viscid secretion of these hairs. The order is a very large one: there are said to be 9,000 European species alone, supposed to be not a twentieth part of the whole number. About 4,000 are described as North American. A few are useful scavengers, but many are injurious insects, and some are great pests. Gnats, mosquitos, ear-flies, blow-flies, bot flies, tsetzes, etc., belong to this order. It is variously subdivided, one division being into four suborders: the *Pupipara*, which are parasitic, and developed in the body of the parent, as the bee-flies; the *Brachycera*, or ordinary flies; the *Neuroptera*, or crane-flies, gnats, midges, mosquitos, etc.; and the wingless *Aphaniptera*, or fleas, which are often ranked as a distinct order. Another division is into the suborders *Orthorhyncha* and *Cyclophorhyncha*, according to the character of the metamorphosis: the former with two sections, *Neuroptera* and *Brachycera*; the latter with also two sections, *Achniza* and *Schizophora*.

(c) The intercessions in the course of which these names were introduced. The recitation of the name of any prelate or civil ruler in the diptych was a recognition of his orthodoxy; its omission, the reverse. The mention of a person after death recognized him as having died in the communion of the church, and the introduction of his name into the list of saints or martyrs constituted canonization. In liturgies the diptychs are distinguished as the *diptychs of the living* and the *diptychs of the dead*, the latter including also the commemoration of the saints. In most liturgies the diptychs are included in the *great intercession* (see *intercession*). direction (di-rek'shon), *n.* [= *F. direction* = *Sp. direccion* = *Pg. direccão* = *It. direzione* = *D. directie* = *G. direction* = *Dan. Sw. direction*, < *L. directio(n-)*, a making straight, a straight line, a directing (toward anything), < *dirigere*, pp. *directus*, direct: see direct.] 1. Relative position considered without regard to linear distance. The direction of a point, A, from another point, B, is or is not the same as the direction of a point, C, from another point, D, according as a straight line drawn from B through A and continued to infinity would or would not cut the celestial sphere at the same point as a straight line drawn from D through C and also continued to infinity. Every motion of a point has a determinate direction; for if any motion from any instant were to lose all curvature, it would tend toward a determinate point of the celestial sphere, which would define its direction at the instant when it ceased to be deflected. It is inaccurate to say that a line has a determinate direction, because a motion along that line has either one or two opposite directions. Yet the word direction is sometimes used in a loose sense in which, opposite directions not being distinguished, the direction of a line is spoken of, meaning the pair of opposite directions.

The direction of a star is seen at a glance, while the most profound science and the most accurate observations have not enabled the astronomer to ascertain its distance.

Jer. Taylor, *Works* (ed. 1885), II. 278.

The principal ecclesiastical directories are: (1) The set of rules drawn up in 1044 by the Westminster Assembly of Divines, to take the place of the Book of Common Prayer of the Church of England, ratified by Parliament in 1645, and adopted by the Scottish General Assembly the same year. Under the Directory the legislative power was vested in a Council of Ancients, or Senate, of 250 members, composed of men above forty years of age, and a Council of Five Hundred, or Lower House, with which rested the initiative in legislation.

Sp. *dis-*, *des-*, *dis-* = *It.* *dis-*, *des-*, *s-* (the *Rom.* forms varying according to position, age, or other circumstances, and often coexisting), *< L.* *dis-*, an inseparable prefix, remaining unchanged before *c*, *p*, *q*, *s*, and *t* (and sometimes *g*, *h*, *j*, and *r*, and in *ML.* at will, and hence in *Rom.*, etc., in all positions), and usually before a vowel, regularly changed to *di-* before *b*, *d*, *g*, *j*, *l*, *m*, *n*, *r*, and *v*, to *di-* before *f*, to *di-* before a vowel (as in *dirigere* and *dirigere*: see *disrupt*), orig. In *ML.* and *Rom.* the prefixes *dis-* (*OF.* *des-*, *dis-*) and *de-* (*OF.* *de-*, often written *des-*, *def-*, etc.) in the separative and privative senses were often used interchangeably; hence many words having original *L.* *de-* may appear in the modern languages with *dis-* (*def-*, etc.), while others having original *L.* *dis-* (*di-*, etc.) may appear with *de-*; cf. *defect* = *differe*, *defume*, *deform*, *defy*, etc., in which *de-* and *dis-* are involved. Discoidal cell or areolet, in entom., a name variously applied, in different orders of insects, to cells near the center of the wing. In the dragon-flies they are exterior to the triangle; in the *Aphides* they are the cells limited by the oblique nervures; and in the *Hymenoptera* they are two or three cells near the center of the wing, between the cubital and anal nervures.—**Discoidal cleavage, egg-cleavage, or segmentation of the vitellus**, one of several forms of cleavage distinguished by Haeckel. (See *discoid*.) It occurs in meroblastic eggs, or those in which there is a large quantity of food-yolk or nutritive protoplasm in comparison with the small amount of germ-yolk or formative protoplasm. It occurs in all birds' eggs, in which the round, flat germ-disk, commonly called the *centric disc* or *blastodisc*, may be observed upon the surface of the yolk. In impregnated eggs, even when freshly laid, the germ-disk may be resolved by moderate magnifying power into a flattened mass of little cells which have already arisen by this form of cleavage of the original parent cell or discocytula, and have become a discomonomerula, or even advanced to the stage of a discoblastula or discogastrula.—**Discoidal epipleura**, in entom., borders of the elytra which are strongly deflexed, appearing like processes of the lower surface of the disk. *Kirby.* **Discoidal nervures**, in entom., the nervures in the center of the wing, entirely unconnected with other nervures, as in certain *Coleoptera*.—**Discoidal placenta**, a placenta, or afterbirth which has the form of a circular flattened cake, as that of man, monkeys, bats, insectivores, and the rodents.

Discomedusae (dis'kō-mē-dū'sh), *n. pl.* [*NL., pl. of Discomedusa.*] An order of the class *Hydrozoa* and subclass *Scyphomedusa*, including the discophorous hydrozoans, or *Discophora* in a strict sense, as those *actinophora* commonly called jelly-fishes: so called from the large umbrella-like disk which these organisms possess. Most jelly fishes belong to this order. They are technically characterized as *Scyphomedusae* which develop as sexual medusiform individuals by transverse fission from a scyphistoma (which see), or else directly from the egg; with 4 peritridial, 4 interradial, and sometimes accessory adradial tentaculicysts; 4 or 8 genital lobes developed from the endoderm forming the oral floor of the enteric cavity, which is extended into 4 or 8 pouches; and with the mouth either opening simply at the end of a rudimentary manubrium or provided with 4 or 8 arm-like processes. According to the character of the mouth, the *Discomedusae* are divided into three suborders, *Cubozoa*, *Scyphozoa*, and *Rhizozoa*. To the last of these belongs the genus *Cyanea*. (See cut under *Discomfit*.) The order as here defined is contrasted with the three orders *Lacernariae*, *Ctenomedusae*, and *Pruvometusae*, and is included with them in the subclass *Scyphomedusae*. Characteristic genera of discomedusans are *Discomedusa* and *Nautiloth* among the simple cubozoan forms; the scenostomous *Chrysaora*, *Physalia*, *Cyanea*, and *Aurelia*; and the rhizotomous *Cephea*, *Cassiopeia*, and *Rhizostoma*. The term *Discomedusae* has also been wrongly extended to other scyphomedusans, thus becoming synonymous with the subclass *Scyphomedusae*, or with *Discophora* in one of its senses.

3. In *math.* See the extract.

The term *discontinuous*, as applied to a function of a single variable, has been used in two totally different senses. Sometimes a function is called *discontinuous* when its algebraic expression for values of the variable lying between certain limits is different from its algebraic expression for values of the variable lying between other limits. Sometimes a function of x , $f(x)$, is called continuous when, for all values of x , the difference between $f(x)$ and $f(x+h)$ can be made smaller than any assignable quantity by sufficiently diminishing h , and in the contrary case *discontinuous*. If $f(x)$ can become infinite for a finite value of x , it will be convenient to consider it as *discontinuous* according to the second definition. Stokes.

Continual drinking is most convenient to the distemper of an hydropic body, though most *disconvenient* to its present welfare. Ep. Reynolds, On the Passions, xl.

Discophora (dis-kof'ō-rā), *n. pl.* [*NL., neut. pl. of discophorus*: see *discophorus*.] 1. The discoidal hydroids, a subclass of *Hydrozoa*, comprising most of the organisms known as jelly-fishes, sea-jellies, or sea-nettles. The latter name is given them from the power they possess, like other hydroids, of arising by means of their thrall cells. The hydroid consists of a single under the like disk, by the rhythmic contraction of which the creature swims, and from the center of which hangs a single polypite or digestive individual, or, less frequently, several.

They are free swimming oceanic animals, whose body consists of such soft gelatinous substance that a specimen weighing several pounds when alive weighs when dried hardly as many grains. The *Discophora* include many alelephas, in the usual sense of that term, and are also called *Medusae*, *Ephyrae*, *Medusae*, and *Aerolidae*. They have been divided into *Calypso* (Lucernaria), *Rhizostoma*, and *Monostoma*. The term *Discophora* is also restricted to the last two of these, excluding the *Lucernariae*. Thus, by Claus, the *Discophora* are made a suborder of *Scyphomedusae*, synonymous with *Aerolidae*, and characterized as disk shaped alelephas with the margin of the disk 8-lobed, at least 8 submarginal sense-organs, as many ocular lobes, and 4 great cavities in the umbrellae for the generative organs. In this strict sense the *Discophora* correspond to the *Discomedusae* (which see). For several wider and inconsistent uses of the term, see the extract.

The binary division of the *Hydrozoa* was established by Eschscholtz (1829), whose *Discophora phanerocarpae* correspond to the *Scyphomedusae*, whilst his *Discophora cryptocarpae* represent the *Hydrozoidea*. The terms point to distinctions which are not valid. In 1853 Kölliker used the term *Discophora* for the *Scyphomedusae* alone, an illegitimate limitation of the term which was followed by Louis Agassiz in 1860. Nicholson has used the term in a reverse sense for a heterogeneous assemblage of those medusae not classified by Huxley as *Lucernariae*, nor yet recognized as derived from hydroid trophozoites. This use of the term adds to the existing confusion, and renders its abandonment necessary. . . . The term *Discophora* is used by Claus for the *Discomedusae*. Kny, Brit. XII. 556.

Bank discount is simple interest paid in advance, and reckoned, not on the sum advanced in the purchase, but on the amount of the note or bill. This is the method recognized in business and in law.

True discount is a technical term for the sum which would, if invested at the same rate, amount to the interest on the face value of the note or bill when due: thus, \$5 is the bank discount at the rate of 5 per cent. on a bill drawn at twelve months for \$100; while \$4.7619 is the true discount, because that sum if invested at 5 per cent. would at the end of a year amount to \$5.

True discount may be found by multiplying the amount of a bill or note by the rate of discount and dividing by 100 increased by the rate; while bank discount is computed in the same manner as simple interest.
